A. GENERAL & TECHNICAL INFORMATION

FEATURES

This manual-focus high-class single lens reflex camera is the fruit of our efforts in pursuit of a small, lightweight and easy-to-use high-performance camera.

For light metering, this camera employs not only the center-weighted average light metering and spot light metering system but also an evaluative light metering, which has appeared for the first time on a CONTAX SLR.

1. Small and Light Body

This SLR camera is as small and lightweight as CONTAX S2.

Dimensions: 137 W × 92.5 H × 53.5 D (without the Back Cover Grip)

Weight: about 460 g (without the batteries)

2. Evaluative Light Metering System

The camera employs the evaluative metering system. The picture area is divided into five segments and the light at each segment is measured independently so that even a subject with backlighting or spotlighting can be photographed with almost no exposure compensation. In addition, the camera displays the difference between the values calculated by evaluative metering and center-weighted average metering in the viewfinder. Through this display, the photographer can know how the camera is evaluating the light at the subject.

3. Bright Viewfinder

The easy-to-use manual-focus camera realizes not only a clear, easy-to-see viewfinder but also ensures a sufficient field of view.

4. Custom Function

The photographer can select the following functions for easier use.

- Use of AE Lock activated by depressing the Shutter Release Button halfway.
- A.B.C. exposure order
- · Leaving the film leader outside the film cartridge after rewinding
- Rewinding at the end of the film
- · Film loading method

5. Flash Auto Setting Function

The TLA 360 Flash Unit, when used together with this camera, indicates the camera's film speed and aperture data on the display panel at the back of the flash unit. In addition to the exposure compensation by the camera body, exposure compensation by the flash unit is available so that the camera used with the flash unit can adjust the balance between flash light and natural light. The TLA 360 Flash Unit is equipped with an auto power on/off function to save power. Even when the flash unit is in the power off status as a result of this auto power off function, depressing the Shutter Release Button halfway will activate the power on function to start charging. Thanks to these auto setting functions, the flash unit and the camera body can be used as a unified system.

6 Shutter

The highly reliable, high-precision shutter operates at high speeds up to 1/4000 second.

7. Multifunctional Data Back D-9

The Data Back D-9 designed only for this camera can record on the film not only date but also exposure data at picture taking.

- Compiled data imprinting function (photographic data of all the frames can be imprinted onto the first two frames of the film).
- Inter-frame imprinting function (data in one selected mode are imprinted between frames of the film).
- · Interval shooting function allows fixed point shooting and unattended shooting.

CONTAX Aria Specifications

Type

: 35mm focal-plane type AE single lens reflex camera.

Picture Size

: 24x36 mm

Lens Mount

: Contax / Yashica MM mount

Shutter

Vertical-travel focal-plane shutter.

Shutter Speeds

: 16 sec. - 1/4000 sec. at "Av" and "P";

4 sec. - 1/4000 sec. at "Tv"

Sync Contacts

B,X (1/125 sec.), 4 sec. - 1/4000 sec. on manual.

: Direct X contact (synchronizing speeds 1/125 sec. or slower) provided with direct contact and sync terminal.

Self-timer Shutter Release : Electronic self-timer; trips the shutter after 10 sec. delay. : Electronic release, provided with a special release socket.

Exposure Control

: ① Aperture-priority auto exposure.

② Shutter-Speed-priority auto exposure.

3 Programmed auto exposure, 4 Manual exposure,

5 TTL auto-flash, 6 Manual flash.

Metering System

: TTL evaluative metering / center-weighted average light metering / spot

metering switchover.

Metering Range

: EV2 - 20 (with an F1.4 lens and ISO 100 film)

Film Speed Range

: ISO 25-5000 for automatic setting with DX code, ISO 6-6400 for manual

AE Lock

The quantity of light on the image surface is stored in memory.

Exposure Compensation A.B.C. Mode

+2 EV to -2 EV (can be set in 1/3-step increments). \pm 0.5 EV/ \pm 1 EV exposure compensating values with A.B.C. lever.

Flash Light Control

TTL direct light control.

Flash Synchronization

In combination with dedicated flash, the shutter speed is automatically set

when the flash is fully charged.

Automatic Flash Setting

: Possible in combination with dedicated flash capable of automatic flash

setting.

Second Curtain Synchronization

: Possible in combination with dedicated flash capable of second curtain synchronization.

Viewfinder

: Pentaprism eye-level finder (long eye-point type)

•Field of view 95% Magnification 0.82X

(With 50 mm normal lens at infinity, -1 D diop.)

Diopter Adjustment Focusing Screen

: Eyepice correction lenses can be attached (8 optional FL type diopter lenses) : Horizontal split-image / microprism type (FU-4) (standard), interchangeable

screens (FU type) are also available.

Viewfinder Display

: Flash mark, Shutter speed, aperture value, metering mark, exposure warning mark, exposure meter, manual exposure mark, exposure compensation mark,

exposure counter / self-timer remaining time / A.B.C. mode / film end.

Display Panel

: Exposure counter / A.B.C. mode / film speed / self-timer remaining time / elapsed time on bulb exposure / custom function mark, battery warning mark, self-timer mark, continuous shooting mark, single-frame shooting mark,

multiple exposure mark.

Film Loading Film Advance

: Auto loading, film automatically advances to "01" on exposure counter.

Automatic winding with built-in motor.

Film Rewinding

: Automatic rewinding with built-in motor, automatic stop and mid-roll rewinding possible.

Drive Modes Winding Speed

: Single frame, continuous, self-timer, multiple exposure.

: Up to approx. 3 frames / sec. on continuous shooting ("C" mode)

(with a new battery, at ordinary temperature, as tested according to Contax testing standard).

Exposure Counter Accessory Shoe

: Display panel and viewfinder, both automatically resetting, additive type.

: Direct X - contact (provided with TLA flash contact).

Custom Functions

: ① AE lock / unlock by depressing shutter release halfway

② Switching of A.B.C. shooting order③ Film end is not wound into the cassette

4 Film not automatically rewound when film reaches end

5 Film advance method

Camera Back

: Can be opened with camera back opening lever, detachable, with film check

window.

Power Source

: Two 3V lithium battery (CR2).

Battery Check

: Automatic check, battery warning mark on display panel.

Battery Capacity

: About 90 rolls of 24-exposure film (with a new battery, at ordinary

temperature, as tested according to Contax testing standard)

Other Details

: Aperture stop-down button

Dimensions, Weight

: 137 (W) x 92.5 (H) x 53.5 (D) mm (depth excludes camera back and grip)

460g (excluding batteries)

Specification of the CONTAX Aria DATA BACK D-9

Type

: Multi-function type, data recording and camera control unit.

Coupling to Camera

Codeless connection via signal coupling contact.

Data Display

Liquid crystal display

Data Printing System

Automatic imprinting coupled to shutter.

Data Printing Position

First two frames on the film, and between the frames.

Confirmation of Data Imprint

Blinking of collective imprinting warning lamp (on collective imprinting), and blinking of PRINT mark (on collective imprinting and between-the

-frames imprinting).

Imprinting Modes

: On collective exposure data imprinting: Exposure data at the time of shooting (exposure compensation value, shutter speed, aperture value,

exposure mode).

On between-the -frames imprinting: Dates (year/month/day, month/day/year, day/month/year), time (day/hour/minute), exposure data at the time of shooting (exposure compensation value, shutter speed, aperture value, exposure mode), counter data + two characters, desired 6-digit fixed number

+ two characters, no imprinting.

Interval Shooting

: Start time: Setting on day/hour/minute Interval time: Settable at intervals

from 2 sec. to 99 hours 59 min. 59 sec. Number of shots to be taken: 1-99.

Confirmation of Interval Operation: Blinking of INT mark

Mode Switchover

: With "MODE" button

Film Speed Calendar : Automatic setting coupled to ISO setting on the camera. : Auto-calendar for displaying the lower two digits of the year.

Power Source

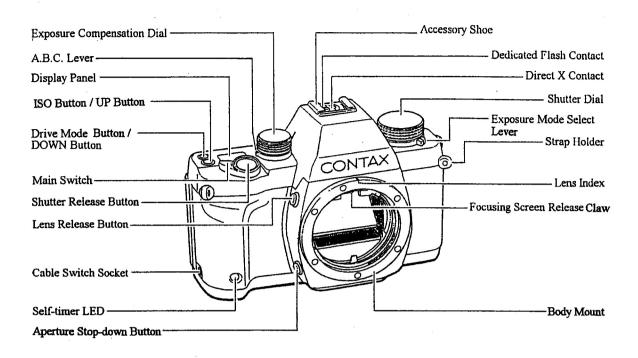

: Two 3V lithium batteries (CR2025)

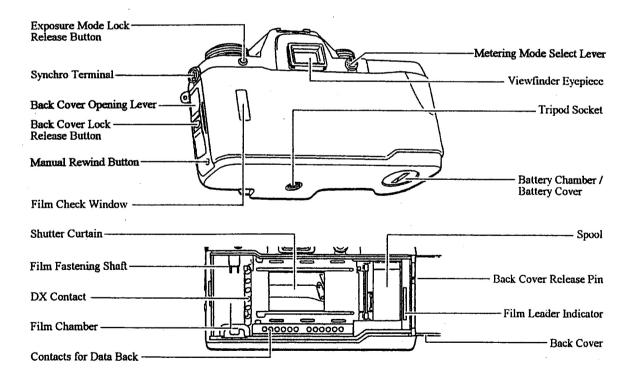

Dimensions & Weight

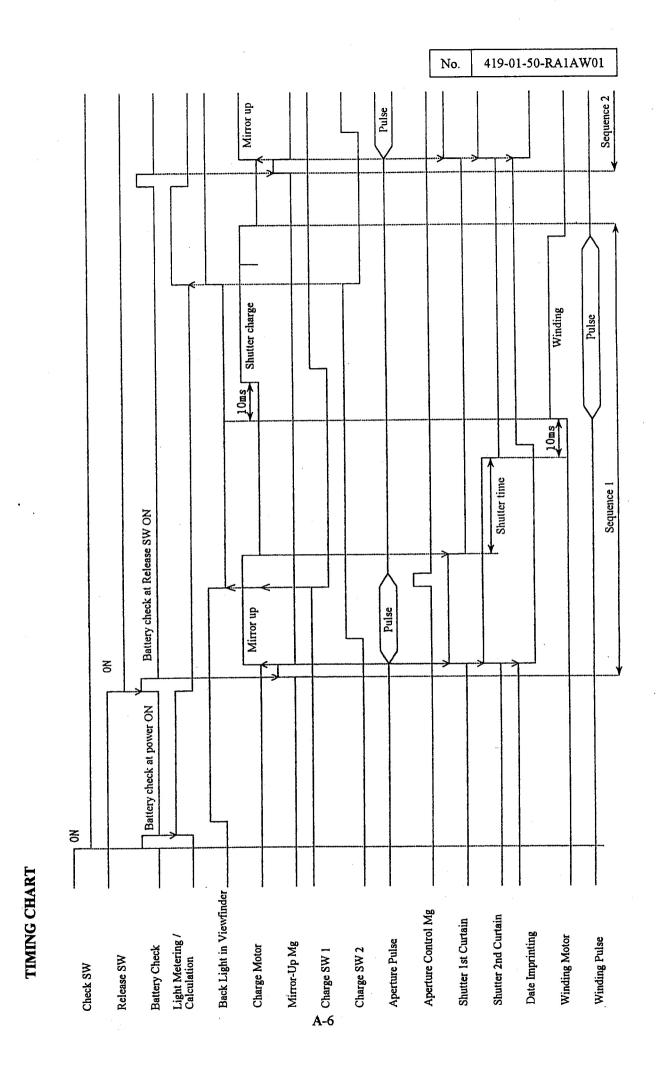

: 135.5 (W) x 56.5 (H) x 20.5(D) mm, 100g (without batteries)

^{*} Specifications and design are subject to change without notice

NAMES OF PARTS

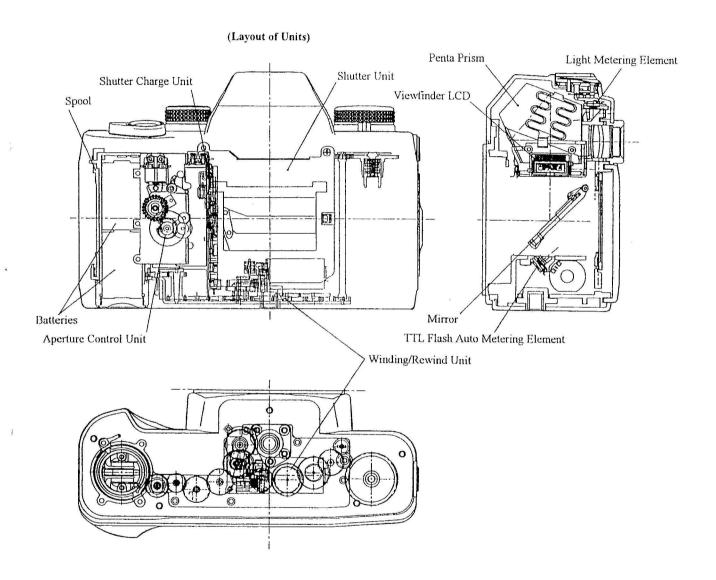

DESCRIPTION OF MECHANISMS

[Internal Structure]

The internal units and parts are arranged effectively to realize this down-sized high-performance camera. The two 3-volt lithium batteries (CR2), as the power source of this camera, are located inside the spool. The main units of the aperture control, mirror drive and shutter drive mechanisms are arranged in the left space inside the camera body. The winding and rewinding mechanism is located at the bottom and the two motors to drive the these mechanisms are placed in the lower space inside the body. With this arrangement, the camera is well balanced.

[Principal Mechanisms]

1. Mirror-Up and Shutter Charge Mechanism

The control mechanism for the mirror, aperture and shutter consists of one motor and two plungers. The shutter release sequence is such that the plungers are operated to disengage the S. Charge Lever first and then the motor is started. Via the speed reduction gear train, the Shutter Cam Gear and Mirror Cam Gear rotate to let the S. Charge Lever retract, thus releasing the trigger of the shutter.

Linked with the S. Charge Lever, the Mirror-Up Lever is also disengage to perform mirror up. At the same time, the Aperture Lever operates to stop down the aperture.

The aperture value is controlled by counting the pulses sent from the encoder which is coupled with the motion of the mechanism. When the number of pulses has reached the predetermined count, the plungers are energized to stop the motion of the mechanism, where the intended aperture value is set.

After the travel of the first and second curtains of the shutter, the motor is started again. By the operation of the motor, the Shutter Cam Gear and Mirror Cam Gear perform mirror down and shutter charge and restore the aperture control mechanism to the original position. The timings for these motions are so distributed that the motor is loaded evenly. The operation of the motor is controlled by the signal sent from the timing switch on the Mirror Cam Gear.

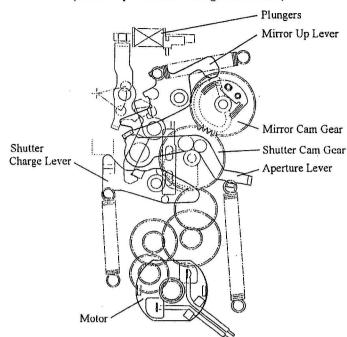

2. Film Transport Mechanism

The motor for winding and rewinding is located in the lower center of the camera body. As the motor is switched between forward run and backward run, the Epicyclic Lever position is so changed that the rotating power is transferred to the Winding Gear Train or the Rewind Gear Train to perform winding or rewinding.

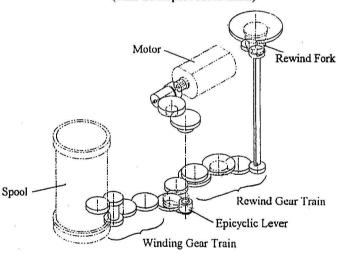

At winding, the film travel is monitored by detecting directly the travel of a perforation with a photo-reflector to determine the film stop position. An encoder and photo-interrupter are located at the first stage of the gear train to detect the motion of the drive system precisely, thus ensuring a higher accuracy of frame feed.

Also the drive pulse from the encoder and photointerrupter enhances the accuracy of imprinting position of the compiled data when the Data Back D-9 is used.

(Mirror-Up & Shutter Charge Mechanism)

(Film Transport Mechanism)

[Electric Circuit]

The electric circuit consists of two high-speed CPUs and other parts.

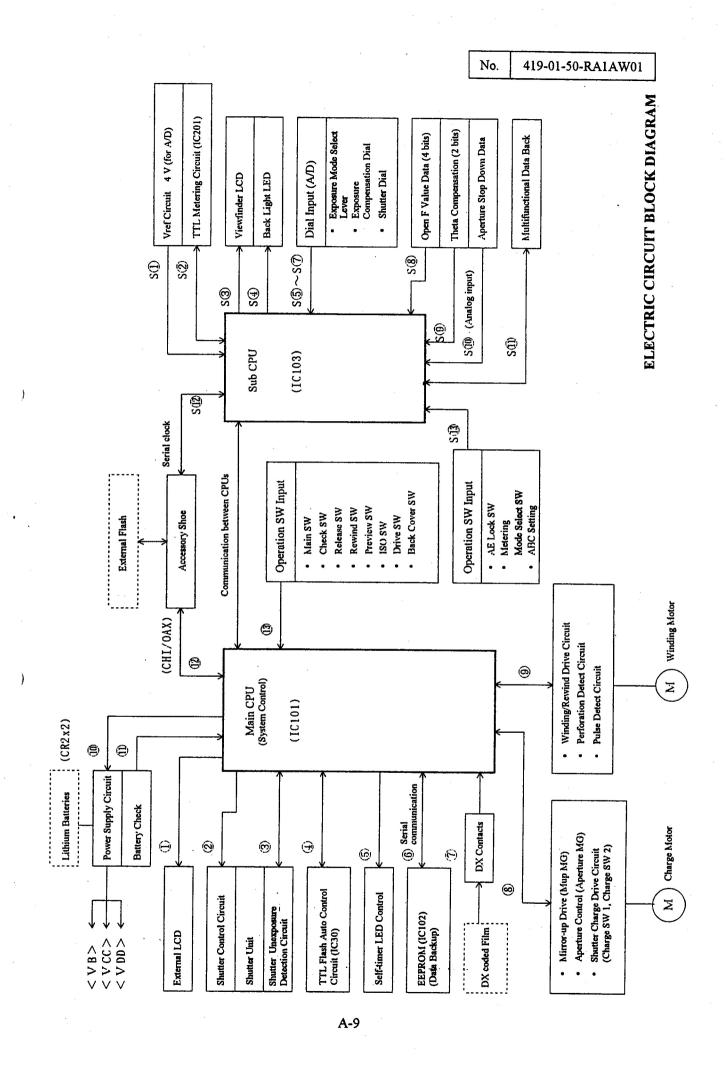

The Main CPU controls the shutter, shutter charge, aperture stop-down and winding/rewinding mechanisms and the comprehensive system of the camera. The Sub CPU controls chiefly light metering, flash communication and Data Back communication. In this way, the control of the camera system and mechanisms is performed independently of light metering, flash communication and Data Back communication, which are constantly carried out. Thanks to this independence, the total control of the camera is processed at a high speed.

The external display is controlled by the Main CPU, while the viewfinder display is controlled by the Sub CPU. The camera is equipped with two motors — one for winding/rewinding only and the other for mirror up, shutter

charge/mirror down and aperture stop-down.

The TTL Flash Auto Control Circuit, mounted on the bottom of the Mirror Box, detects the light reflected by the film surface during exposure and controls exposure.

The power supply circuit, designed for power saving, automatically turns power OFF when 16 seconds have passed without any operation of the camera.

[Functions of the Circuits and Explanation of the Signal Lines Shown in Electric Circuit Block Diagram]

☆ Functions and Signal Lines Associated with Main CPU

1. External LCD

The reflection type LCD indicates film speed (DX, ISO), drive mode (S, C, self-timer mode), multi-exposure mark, battery warning and 7-segment 4-digit display (ISO, exposure counter). The Main CPU circuit is divided into three sections and the LCD is driven by the built-in LCD driver (drive voltage: 5 V).

(1) LCD (External): SEG (12 lines) × COM (3 lines) = Max. 36 segments

2. Shutter Drive Circuit

The Shutter Drive Circuit controls the holding of the two magnets for the first and second curtains. This circuit is part of the Regulated DC Voltage Drive Circuit.

② Main CPU → Shutter Magnet control: 1st curtain control signal, 2nd curtain control signal.

3. Shutter Unexposure Status Detection

To detect the unexposure status of the shutter (shutter has not opened), the photo-reflector located around the aperture of the shutter monitors the motion of the shutter blades.

③ Unexposure status detection :

Main CPU → Transistor → Photo-reflector : LED drive Photo-reflector → CPU : Detection pulse (A/D read in)

4. TTL Flash Auto Control Circuit

This circuit integrates the light reflected by the film while the shutter is open, and stops flash when the optimum amount of light is attained.

The integration start signal and ISO data (serial communication) are input to the IC and the flash stop signal is output from the IC.

④ TTL Flash Auto IC control: Main CPU → TTL Flash Auto IC: CS, SDO, SCK, CHC

TTL Flash Auto IC → Main CPU: CHS → CHI/O → Main CPU

5. Self-timer LED Control Circuit

This circuit makes the LED blink during operation of the self-timer (for 10 seconds).

⑤ Main CPU → Self-timer LED: LED lighting signal

6. Data Backup (EEPROM)

Adjusted values and camera status are stored in EEPROM.

⑤ Serial communication: SCK, SDI, SDO (also used for test adjustments; SCK and SDO are also used with the TTL Flash Auto IC).
Main CPU → EEPROM: EEPROM - CS

7. DX Contacts

These contacts read in the DX code.

⑦ DX Contacts → Main CPU: 5-bit input

8. Mirror Control, Aperture Control, Shutter Charge Drive Circuit, Charge Switch

Mirror up is performed by the Mirror-up Magnet and mirror down is driven by the S. Charge Motor.

Aperture control is such that the S. Charge Motor drives the Aperture Lever and upon the detection of the predetermined number of aperture pulses, the Aperture Magnet is turned ON to stop the Aperture Lever.

A-10

For shutter charge drive, the motor runs only forward so that the cam to move the S. Charge Lever is turned in one direction to perform shutter charge and to retract the S. Charge Lever immediately before shutter travel. The completion of the S. Charge Lever retracting and the completion of shutter charge are detected by the operation of the Charge Switch 1 and Charge Switch 2.

The circuit incorporates a braking function to stop the cam at the correct position upon completion of shutter charge.

S. Charge Motor drive Main CPU → Cam drive motor driver: Control signal × 2

S. Charge Lever position detect Charge SW 1 → Main CPU: Completion of S. Charge Lever retracting

Charge SW 2 → Main CPU : Completion of shutter charge

Mirror-up drive Main CPU → Mup MG drive circuit: Mup MG control signal

Aperture control Main CPU → Aperture MG drive circuit: Aperture MG control signal

Main CPU → Photo-interrupter: LED drive Photo-interrupter → Main CPU: Control pulse

9. Winding/Rewind Drive and Perforation Detect Circuit

The winding and rewind mechanism is driven by one dedicated micro motor. Winding is performed by the forward run of the motor, while rewinding is by the reverse run. The brake function ensures each correct film advance by one frame (8 perforations). Perforation detection is performed by a reflection type photo-reflector. In addition, for inter-frame imprinting of data by the multi-functional Data Back, the detection to ensure precise film transport control is performed by a photo-interrupter.

Winding drive motor control

Main CPU → Winding motor driver: Control signal × 2

Perforation detection

Main CPU → Photo-reflector: LED lighting signal Photo-reflector → CPU: Perforation pulse (A/D read in)

Fine film transport detection

Main CPU → Photo-interrupter: LED lighting signal

Photo-interrupter -> Main CPU: Control pulse

10. Power Supply Circuit

Circuit voltages are supplied from the four power supplies, namely, VB, VCC, VDD and Vref.

VB, which is equal to the battery voltage, supplies power to the circuits which require large power.

VCC, irrespective of the control signal sent from the Main CPU, outputs regulated DC power through the DC/DC IC to permit operation during PH-OFF (DC/DC operation is OFF). The output from VCC is 5.0 ± 0.2 when the input is 5.4 to 6.5 V with the DC/DC IC turned OFF and when the input is 2.5 to 6.5 V with the DC/DC IC turned ON.

VDD, upon receiving the control signal, turns ON the DC/DC Converter, reinforces VCC and supplies power from the reinforced VCC through a transistor. The output voltage of VDD is 5.0 ± 0.5 V when the input voltage is 3.0 to

 Main CPU → DC/DC Converter: PH control signal (PH 1) Main CPU → VDD control transistor: PH control signal (PH 2)

11. Battery Check

The circuit is so set that the battery voltage is divided by resistance and a voltage in proportion to the battery voltage is read in by the CPU.

The transistor turns ON and OFF so that no current flows through the resistors in the power-OFF state. (Switching by VDD: ON at power ON and OFF at power OFF)

 Battery check circuit → Main CPU: Battery monitor voltage (read in by A/D conversion) Main CPU → Battery check circuit: PH control signal (also used by PH2 : switching by VDD)

12. Accessory Shoe

To the Main CPU, only CHI/O (CHS) and AX are connected.

Main CPU → Transistor → Accessory Shoe : AX signal Accessory Shoe (CHI/O) → Transistor → Main CPU : CHS

13. Operation Switches

The signals from external operation switches are input to the Main CPU. The operation switches whose signals are input to the Main CPU are limited to those each of which, when operated, brings the camera into the power-ON state.

- ☆ Functions and Signal Lines Associated with Sub CPU

S1. Vref Circuit

This circuit, through the 4 V Regulated DC Voltage IC, supplies the reference voltage Vref for A/D conversion.

S ① Vref circuit → Sub CPU: Vref (for A/D conversion)

S2. TTL Light Metering Circuit (Light Metering IC)

The light metering system permits evaluative metering (5 divisions), center-weighted average metering and spot metering. The light metering range is EV 2 to 20 (50/F1.4 lens, ISO 100), also in evaluative metering. As the light metering element, a 5-divided Light Metering IC is used and the light metering output and temperature output are read in by the CPU through A/D conversion.

S ② Light Metering IC → Sub CPU: TO, PO (read in through A/D conversion: Vref = 4 V)
Sub CPU → Light Metering IC: D1, D2, D3 (SPD select signal)

S3. Viewfinder LCD

The transmission type LCD displays the necessary information in the viewfinder based on externally input data processing and other processes. The circuit is 3-time-divided and uses the LCD driver incorporated in the Sub CPU.

S 3 LCD (in viewfinder): SEG (22 lines) × COM (3 lines) = 66 segments

S4. Back Light LED for Viewfinder LCD

The Back Light LED for Viewfinder LCD changes its brightness according to the light metering result. This LED is controlled through two control lines and driven by the Sub CPU. (Brightness changes in three steps.)

S ④ (LED control) Sub CPU → Transistor → LED : Back Light LED lighting signal (2 lines)

S5. Exposure Mode Selector Lever

The Exposure Mode Select Lever selects among six modes, namely, Av, Tv, P, M, X and B. The input divided by resistance is read in by the CPU through A/D conversion. For the resistance, a chip resistor is used and three lines of VDD, GND and A/D signal are connected to the resistor.

S ⑤ Exposure Mode Select Lever → Sub CPU : A/D conversion (1 line)

S6. Exposure Compensation Dial

This dial is a turning type with a compensation range of \pm 2 EV. It allows 13-step compensation in increments of 1/3 EV. The input divided by resistance is read in by the Sub CPU through A/D conversion. For the resistance, a chip resistor is used and three lines of VDD, GND and A/D signal are connected to the resistor.

S ⑥ Exposure Compensation Dial → Sub CPU: A/D conversion (1 line)

A-12

S7. Shutter Dial

This dial is a turning type that allows setting of 15-step shutter speeds from 4 seconds to 1/4000 second in 1 TV increments. The input divided by resistance is read in by the Sub CPU through A/D conversion. For the resistance, a chip resistor is used and three lines of VDD, GND and A/D signal are connected to the resistor.

SO Shutter Dial → Sub CPU: A/D conversion (1 line)

S8. Open F Value Data

Data input in a 4-bit gray code.

S ® Open F Value P.C. Board → Sub CPU: 4-bit gray code input

S9. Theta Compensation Input

The presence or absence of theta compensation or the lens which can not cope with theta compensation is identified by a 2-bit input.

S ⑨ Theta Compensation Board → Sub CPU: 2-bit input

S10. Aperture Stop-down Value Data

The data on aperture stop-down position is read in by A/D input.

S [®] Aperture stop-down value (AV Board) → Sub CPU : A/D input

S11. Multifunctional Data Back

To connect the Multifunctional Data Back, the camera is equipped with 11 signal contacts, which are the contacts for serial communication, CS and other signals (8 signals in total) and those for W-Up connected to the Main CPU, shutter release signal and GND.

S D Sub CPU → Data Back contacts: serial (SCK, SDO), CS, PRN, DHS Data Back contacts → Sub CPU: serial (SD1), TMP, LMP

S12. Accessory Shoe

To the Sub CPU, the flash communication line is connected.

S ② Sub CPU → Flash Unit: serial clock Flash Unit → Sub CPU: serial DA

S13. Operation Switches

The signals from external operation switches are input to the Sub CPU. The operation switches whose signals are input to the Sub CPU are those which, even when operated, do not bring the camera into the power-ON state.

S ② Operation switches → Sub CPU: 5 lines

★ Communication between CPUs

For communication, access is made only from the Main CPU.

The communication lines consist of a 4-bit bus line, two handshake buses and two timing signal lines.

[Display]

1. Viewfinder Display

For display in the viewfinder, an LCD is employed and the brightness of the back light LED is changed in three steps according to the brightness of the subject so that the display is always easily seen.

The display, located at right in the viewfinder, shows a flash ready indicator, shutter speed, aperture, light metering indicator, manual exposure mark, exposure compensation mark, exposure warning/exposure meter and exposure counter.

The viewfinder display appears at one of the following operations and automatically goes out 16 seconds later for power saving.

1) The Main Switch is turned ON.

Horizontal Split-image-

< Viewfinder Display >

② The Shutter Release Button is depressed halfway with the Main Switch turned ON. In addition, the display is kept on for another 16 seconds when the position of a dial or the like is changed.

Shutter speed
Aperture value
Light metering Mark
Manual exposure mark
Ferosure compensation mark

Exposure counter

Flash Mark:

• When the TLA Flash Unit is used, the flash mark" 3 "lights up upon completion of flash charge.

 After flash firing, the flash mark " * " blinks when the condition of the subject is within the allowable range for TTL Flash Auto Control.

Exposure warning Mark /Exposure meter

Shutter Speed:

• The display shows shutter speeds ranging from 1/4000 second to 16 seconds.

In manual mode : shutter speed is displayed in increments of one step (4" ~ 4000)

In auto mode : shutter speed is displayed in increments of 1/2 step (16" ~ 4000)

Aperture Value:

• In the Aperture Priority AE (Av) mode or Manual Exposure (M) mode, the display shows the manually set aperture value.

• In the Shutter Speed Priority AE (Tv) mode or Programmed AE (P) mode, the display shows an aperture value appropriate to the shutter speed.

Light Metering Mark:

• The display in the viewfinder changes according to the mode selected by the Metering Mode Select Lever.

Center-weighted average light metering mode: "[] "lights up.

Spot light metering mode : " • " lights up.

Evaluative light metering mode : " ights up.

While the AE Lock function is working, the display blinks (2 Hz) as follows:

Center-weighted average light metering mode: "[]" mark blinks.

Spot light metering mode :" • " in " • " mark blinks.

Evaluative light metering mode : " in " in " in " mark blinks.

M Mark:

"M" mark appears when the Exposure Mode Select Lever is set to the manual exposure position "M" or "X".

Exposure Compensation Mark:

"+" or "-" mark will blink when the Exposure Compensation Dial is set anywhere other than "0".

Exposure Warning Mark / Exposure Meter

(1) Exposure meter display

The display shows the following data according to exposure mode:

- ① Only displayed at evaluative light metering in an auto exposure mode (Tv, Av or P), the exposure meter shows the difference from the center-weighted average light metering value.
- ② In the manual exposure (M) mode or in shooting with flash (X), the exposure meter shows the difference between the exposure setting and the correct exposure (for the set light metering mode).
- 3 The exposure meter does not displayed during photography with Bulb.
- (2) Exposure warning mark display

In an auto exposure mode (Av, Tv or P), the overexposure mark "▲" or underexposure mark "▼" indicating deviation from the exposure control range will blink.

Exposure Counter:

The exposure counter shows the number of exposed frames of the film (a number between 00 to 39 or E for any number of 40th and above). It also shows the following information:

- Remaining time will the self-timer is operating (10 seconds to 00).
- Operation sequence at A.B.C. photography (three-frame continuous automatic exposure compensation).
- Completion of exposure of all frames of the film.

2. Display Panel

Exposure Counter / Film Speed:

This part of the Display Panel shows he number of exposed frames of the film. It also shows the film speed when the ISO button is pressed. With film speed set to "DX", this section of the display shows the film speed read by DX when a DX-coded film is used. The display also indicates the following particulars:

- The remaining time while the self-timer is operating.
- · Exposure time during photography with Bulb
- A.B.C. exposure order
- · Custom function setting
- · Completion of exposure of all frames of the film.

ISO Mark:

The ISO mark appears when a film speed is displayed or a film speed is set.

DX Mark:

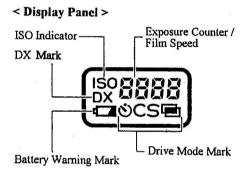

The "DX" mark is always displayed during automatic setting by a DX code.

Battery Warning Mark:

The battery warning mark appears to indicate that the time for replacing the batteries has come.

Drive Mode Mark:

Self-timer mode " \circ "
Single-frame shooting mode " \circ "
Continuous-frame shooting mode " \circ "
Multiple exposure mode " \circ "

FUNCTIONS OF SWITCHES

< External Operation Switches >

(1) Main Switch

This switch turns ON/OFF the power to the camera and switches AE Lock.

OFF	Main Switch OFF
$\downarrow \uparrow$	
ON	Main Switch ON
$\downarrow \uparrow$	
AEL	AE lock (Main Switch is ON)

(2) Check Switch

When the Shutter Release Button is depressed halfway with the Main Switch turned ON, the Check Switch turns OFF \rightarrow ON ("H" \rightarrow "L") so that the circuit power is turned ON, the camera starts AE light metering and the viewfinder LCD lights up. Then the camera will hold the power (for 16 seconds).

(3) Release Switch

When the Shutter Release Button is depressed all the way with the Main Switch turned ON, the Release Switch turns OFF \rightarrow ON ("H" \rightarrow "L") so that the shutter operates and at the same time, the viewfinder LCD goes out. However, the External LCD keeps indicating the data.

(4) Shutter Dial Switch

This switch sets a shutter speed. 1/4000 to 4 seconds (15 steps)

(5) Exposure Compensation Dial Switch

This switch sets an exposure compensation value.

-2 to +2 EV (in increments of 1/3 EV) (13 steps)

(6) A.B.C. Switch

This switch selects a bracketing range for 3-frame continuous exposure control.

0	A.B.C. setting OFF
$\downarrow \uparrow$	
0.5	Setting of A.B.C. operation of ± 0.5 EV
↓ ↑	•
1	Setting of A B C operation of ± 1.0 EV

(7) Exposure Mode Switch

While pressing the Exposure Mode Lock Release Button, turn the Exposure Mode Select Lever to set an exposure mode.

AV	Aperture Priority AE
$\uparrow \downarrow$	
TV	Shutter Speed Priority AE
↑ ↓	
P	Programmed AE
↑ ↓	
M	Manual exposure
↑ ↓	
X	Shooting with flash
↑ ↓	
В	Bulb

(8) Drive Mode Switch / Down Switch

- ① When the Drive Mode Button is pressed, this switch turns OFF → ON ("H" → "L"). Pressing the Drive Mode Button for more than 1.2 seconds will set the drive setting mode.

 Upon setting the drive setting mode, the external LCD indicates the current drive setting, blinking at 2 Hz.
- ② After the detection of pressing the Drive Mode Button once at a successful setting of the drive setting mode, the drive setting is changed in the UP direction by the ISO Button (UP Switch) or in the DOWN direction by the Drive Mode Button (DOWN Switch).

(9) ISO Button Switch / UP Switch

- ① When the ISO Button is pressed, this switch turns OFF → ON ("H" → "L"). Upon detecting "L", the camera enters ISO check mode and the external LCD indicates the current film speed setting.
- When the ISO Button is pressed in the ISO check mode for more than 1.2 seconds, the ISO setting value blinks at 2 Hz and the mode changes to ISO change mode.

The ISO setting value is changed in the UP direction by the ISO Button (UP Switch) or in the DOWN direction by the Drive Mode Button (DOWN Switch).

UP Switch ON
$$\rightarrow$$
 \leftarrow DOWN Switch ON DX \longleftrightarrow 6 \longleftrightarrow 8 \cdots 125 \longleftrightarrow 200 \longleftrightarrow 320 \uparrow \uparrow 6400 \longleftrightarrow 5000 \longleftrightarrow 4000 \cdots 640 \longleftrightarrow 500 \longleftrightarrow 400

(10) Metering Mode Select Switch

This switch selects a light metering mode.

Evaluative light metering

Center-weighted average light metering

↑ ↓
Spot light metering

(11) Rewind Switch

Whether the Main Switch is ON or OFF, pressing the Manual Rewind Button will turn ON the Rewind Switch to start film rewinding operation.

(12) Preview Switch

When the Main Switch is ON and the exposure mode is "AV", "TV", "M", "P", "X" or "B", pressing the Aperture Stop-down Button will turn ON the Preview Switch and stop down the lens to the aperture value set on the Lens. AV, M, X, B ------Lens is stopped down to the preset aperture value.

TV, P ----- Lens is stopped down to the aperture value obtained by arithmetic operation.

< Internal Mechanical Switches >

(13) Back Cover Switch

This switch detects the opening → closing of the Back Cover.

"H" ----- Back Cover closed "L" ----- Back Cover open

Upon detection of the opening -> closing of the Back Cover, the camera starts blank shots advance.

No.	419-01-50-RA1AW01

(14) DX Contact Switch

This contact switch detects the DX code of the film cartridge and reads in a film speed according to the DX code.

- ① Setting range: ISO 25 to 5000 (in 1/3 EV steps)
- ② Detection timing

100 msec after the detection of the opening → closing of the Back Cover.

(3) For a film without a DX code, ISO 100 is read in.

(15) Open F Value Input Switch (4 bits)

This switch detects the Open F value of the Lens mounted.

(16) Theta Compensation Switch

With the MM Lens mounted on the camera, this switch operates coupled with the theta setting pin of the Lens. It converts the theta compensation value to an electric signal and detects the presence or absence of theta compensation.

θ Comp	ens. Code	Lens Type
LENS1	LENS2	
L	Н	MM Lens without θ compensation
Н	L	MM Lens with θ compensation
H	Н	AE Lens

(17) Aperture Information Switch

With a Lens Unit mounted, the mechanism of this switch is engaged with the Aperture Coupling Gear of the Aperture Ring Holding Plate Ass'y and the switch A/D-converts the electrical signal of the aperture value of the Lens (position of the Aperture Coupling Ring) and thus detects the stop-down value of the Lens.

(18) Charge Switch 1 and Charge Switch 2

The Charge Switches are incorporated in the MS Base Plate Ass'y and coupled with the S. Charge Motor.

These switches detect the completion of mirror up or mirror down and shutter charge. There are two Charge Switches, namely, Charge Switch 1 and Charge Switch 2.

- O The completion of mirror up is detected by the turning "H" → "L" of the signal from the Charge Switch 1.
- O The completion of mirror down and the completion of shutter charge are detected by the turning "L" \rightarrow "H" of the signal from the Charge Switch 1 and the turning "H" \rightarrow "L" of the signal from the Charge Switch 2.

DESCRIPTION OF ELECTRIC CIRCUITS

1. Power Supply Circuit

(1) Constitution

This circuit outputs each voltage under control of the Main CPU (IC101). It also detects a battery voltage drop and resets the Main CPU (IC101) by hardware.

(2) Description of Power Supply Lines

VCC: Power to CPU

At start of camera operation, IC101 turns PH1 "L", so that IC105 (DC/DC Converter) becomes active and starts switching boosting. IC105 boosts the voltage at Pin 6 to 5.5 V and outputs 5 V (VCC) at Pin 5 through the internal series regulator.

In standby mode, IC101 turns PH1 "H", thus stopping the switching operation. Then the camera enters the low power consumption state. In this state, the voltage at the battery is supplied through the coil L101, the Schottky diode in Q105 and the above-mentioned series regulator, so that VCC is almost the same as the battery voltage.

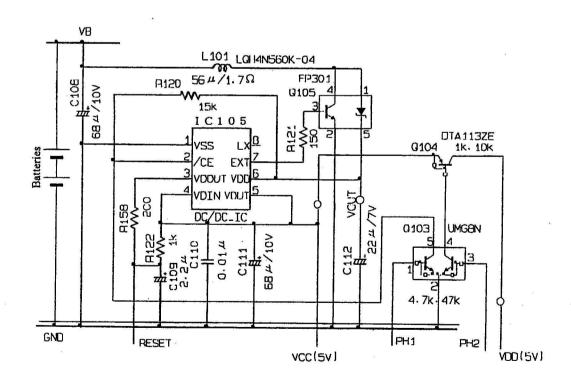

VDD : Power to peripheral circuits

After completion of the above-mentioned VCC boosting at start of camera operation, IC101 turns PH2 "L", thus turning Q104 ON to supply 5.0 V to the VDD line.

In standby mode, IC101 turns PH2 "H" to turn OFF the VDD line.

Vref of IC103: Reference voltage for A/D conversion

This voltage is used as the reference voltage for the A/D conversion in IC103 (Sub CPU). IC104 generates this voltage at VDD. Since this voltage is 4.0 V, the Vref for all the A/D conversion in IC103 is only 4.0 V.

No.	419-01-50-RA1AW01

2. Battery Check Circuit

(1) Battery Check Timing

• Initial battery check: at reset start and at power ON

- Mechanical operation battery check: immediately before blank shots advance, mirror up start and rewinding
- · Battery check immediately before winding during use of Bulb shutter

(2) Indications of Battery Warning Mark

	LCD	VB at Battery Check
LCD lighting.	Battery warning mark off (normal operation)	4.65 V or higher
	Battery warning mark lighting (warning)	4.65 to 4.4 V
LCD off,	Battery warning mark blinking (operation prohibited)	4.4 V or lower

(3) Constitution

The Battery Check Circuit consists of Q106, R118, R119 and C113.

(4) Functions

VB (battery voltage) divided by R118 and R119 is input directly to the A/D terminal of IC101, where the voltage is checked. This voltage is stabilized by C113. Also when VDD is OFF, Q106 turns OFF to cut off the current to be consumed by these resistors. The voltage input to the port for A/D conversion is as follows:

3. Light Metering Circuit

(1) Outline

• Light metering output

The 5-division light metering IC201 incorporating SPDs logarithmically compresses the photocurrent and convents it to a voltage linear to the EV value.

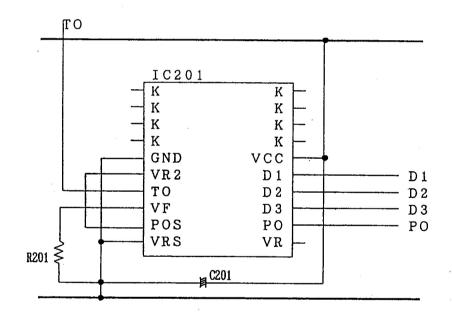

The combinations of signal levels at D1 to D3 of the light metering IC permit a selection of light metering output among the 5 divided patterns.

• Temperature dependence

: Since light metering output is dependent on temperature, IC101 temperature-compensates the light metering output. For this compensation, IC201 outputs the necessary temperature data as a voltage.

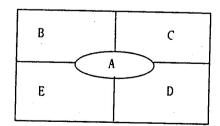

(2) Description of Control Terminals

Terminal Name	Function	Description of Function
PO	Light metering output	Outputs a voltage representing the light metering value for the pattern selected by D1 to D3.
то	Temperature sensor output	Outputs voltage linear to temperature.
D1 to D3	Pattern selection of light metering output	Selects one pattern to be output at PO among five light metering patterns.

=	D1		L	Н	L	Н	_
Input	D2	H	H	H	L	L	L
Ι	D3	H	L	L	L	L	Н
Output	PO	A	В	С	D	E	VR2

No.	419-01-50-RA1AW01

4. Drive Circuit

4-1. Winding and Rewinding Circuit

(1) Constitution

This circuit consists of the Drive IC (IC106) and the surrounding capacitors (C114 to C118).

The Drive IC consists of the H Bridge Circuit (comprising MOS transistors) and its predriving circuit.

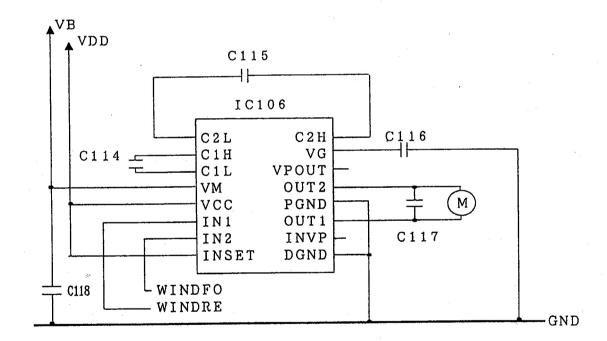

The surrounding capacitors are used in the charge pump (voltage boosting) circuit for the voltage to drive the gates of the MOS transistors.

The Drive IC (IC106) is only used to drive the winding and rewinding mechanism. It is controlled by the IC101 (Main CPU).

(2) Functions

The control terminals are controlled by the Main CPU (IC101) as follows:

Pin No.	Terminal Name	Signal Name	Stop	Winding	Rewinding	Brake
62	P00	WINDFO	L	Н	L	Н
61	P01	WINDRE	L	L	Н	Н

4-2. Shutter Charge Motor Drive Circuit

(1) Constitution

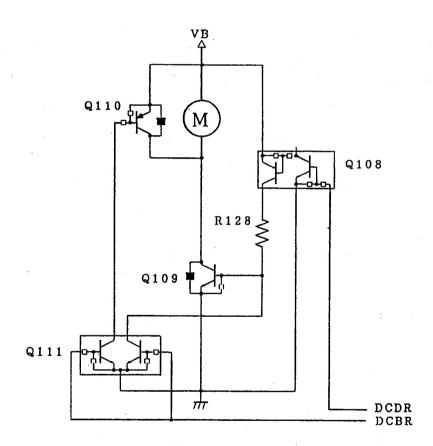

This circuit consists of the transistor (Q109) for driving, the transistor (Q110) for braking and the transistors (Q108 and Q111) for their predriving, and the resistor (R128).

(2) Functions

The control terminals are controlled by the Main CPU (IC101) as follows:

Pin No	Terminal N	Name Signal Nam	ne Stop	Drive	Brake
50	P04	SCDR	L	Н	L
49	P05	SCBR	L	L	н

* Shutter charge is controlled by one-way rotation.

5. TTL Flash Auto Control Circuit

(1) Outline

TTL Flash Auto Control output

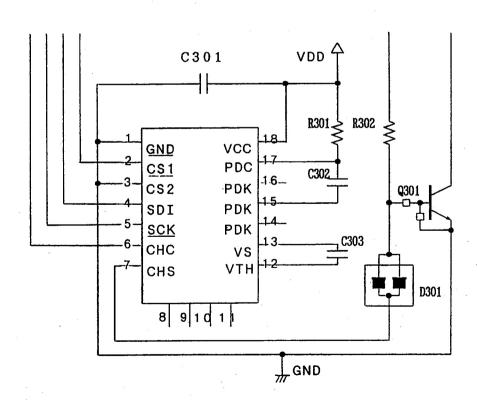

: The TTL Flash Auto IC (IC301) starts integration (accumulation of charges in C302) upon receiving the start signal (CHC: L) from the Main CPU. When the integral voltage has reached the reference voltage (VTH), IC301 outputs the stop signal (CHS: H). This CHS signal is output through D301 to the CHI/O terminal. The CPU, upon receiving the inverted CHS signal (CHS signal) via Q301, conducts TTL Flash Auto indication.

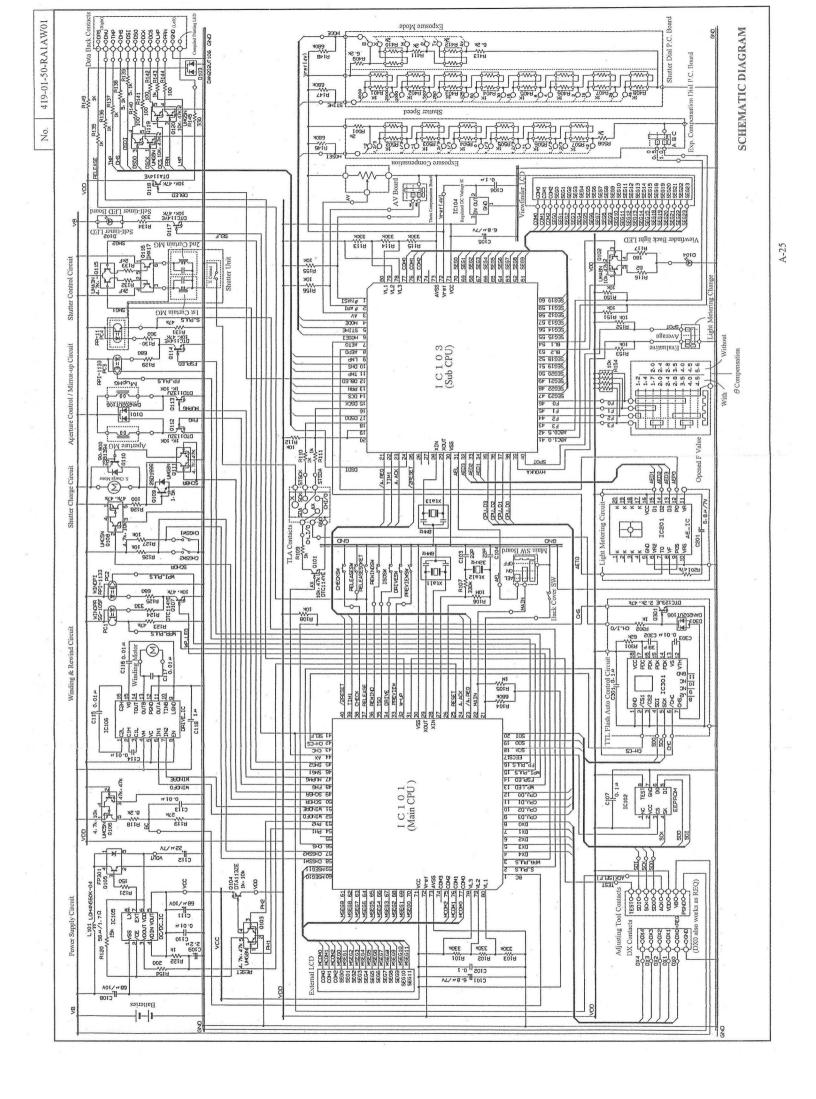

· Reference voltage

The reference voltage VTH varies with ISO values. Each ISO value is transferred in the form of 5-bit data by serial communication and converted to a voltage in IC301.

(2) Description of Control Terminals

Terminal Name	Function	Description of Function		
СНС	Start signal input for TTL Flash Auto control	Conducts TTL Flash Auto operation only during "L".		
CHS	Stop signal output for TTL Flash Auto control	Stops flash firing at "H".		
CHCS	Chip select input	Selects this IC at "L". (By serial communication)		
. SCK	Serial clock input	Clock to transfer ISO data by serial communication.		
SO	Serial data input	Data line to transfer ISO data by serial communication.
