I INTRODUCTION

I – 1 FEATURES

- Newly Developed Self-Loading Mechanism
  By simply depressing the self-loading lever and inserting the film end into the thread slot, the film is pulled and loaded automatically through the most gentle film handling mechanism. The film automatically stops after threading through projector and, by winding the leader on the take-up reel, the projector is ready for projection.

- Push-Button Control
  The operation switch buttons for controlling Forward/Off/Reverse/Pause modes and Lamp On/Off are located on a panel and the LED indication is specially convenient while projecting in the dark.

- Pause Mode
  Pushing the pause button while forward projection allows instant stop and start projection. The comment in mid-projection or operation with some other 16mm/slide projector can be easily made.

- 720m Reel Capacity
  The projector accepts 720m reel and 60-minute non-stop projection is possible.

- High-Normal Lamp Brightness Control
  The high-efficiency and long-life ELC 24V-250W lamp is used. By switching the high-normal lamp switch, the choice of lamp brightness, NORM for normal image and HI for bright image is available.

- Safety Mechanism
  The projector automatically stops when the end of film passes the first sprocket in the film path. If the film breakage occurs during projection the safety mechanism works to have the broken film getaway from the film path and to stop the projector as well.

- Remote Control (Option)
  When the remote control is connected to the receptacle, the functions of Forward/Off/Reverse/Pause modes and Lamp On/Off can be remotely controlled.

- Front Cover with Speaker (Option)
  Two speakers are built in the front cover for the use as an extension speaker. 20m speaker cord is supplied.

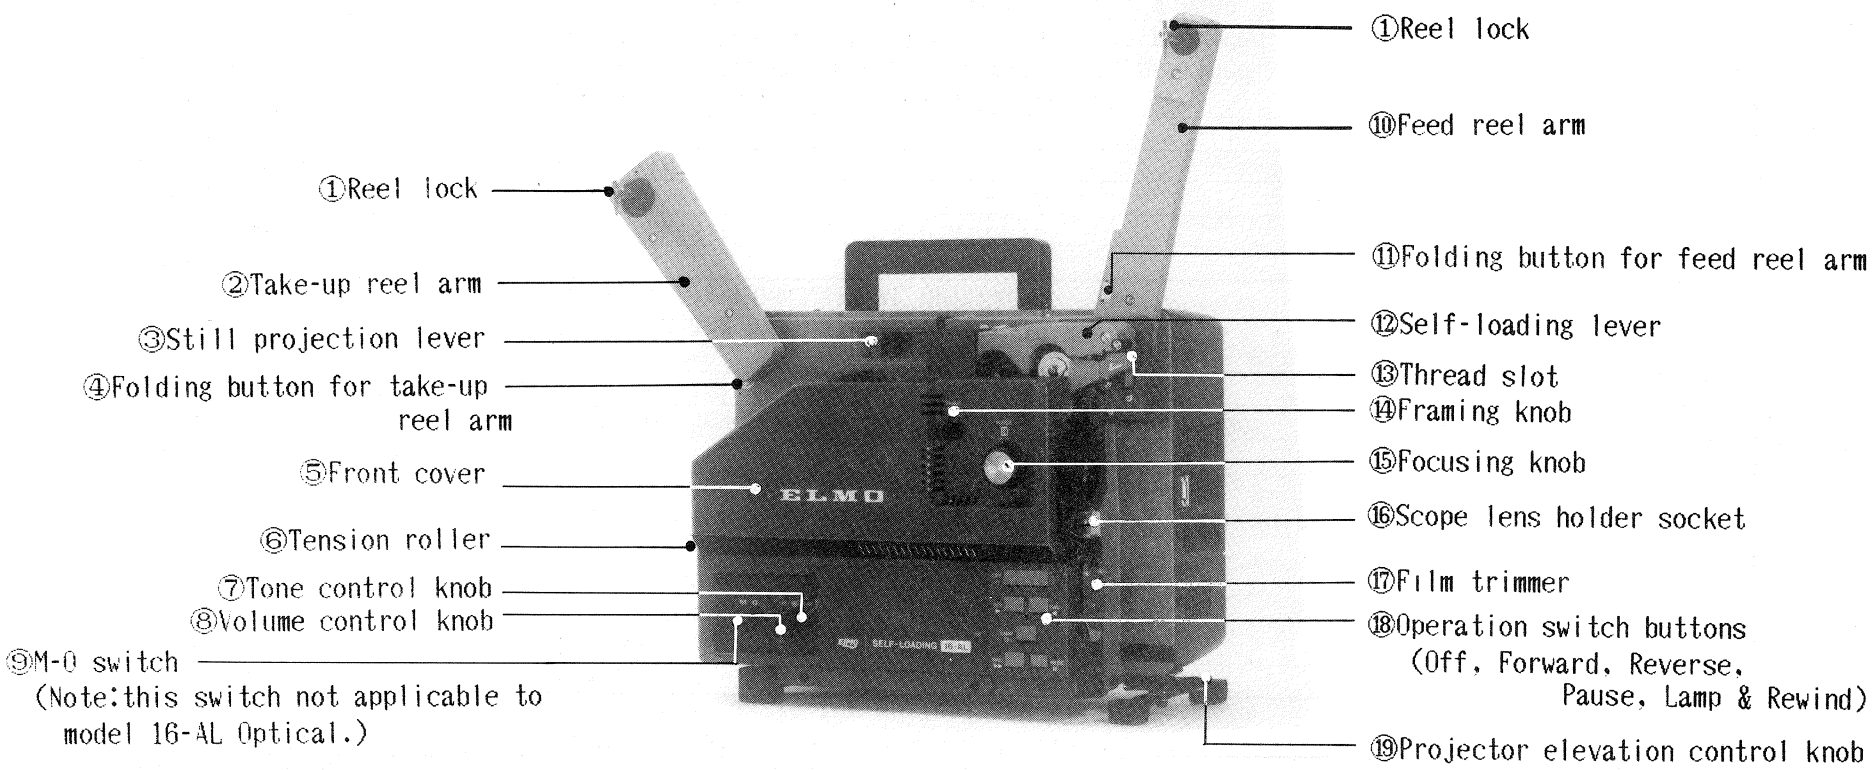
I-2 SPECIFICATIONS

Power surce	AC Single Phase. 50 and/or 60 Hz
Reel capacity	720m (2400ft) max. with accessory reel. 240m (800ft) standard reel with automatic take-up.
Projection speed	24fps (18fps. is also available by model)
Usable film	16mm Optical/Magnetic sound and silent films (16-AL optical is for optical and silent films)
Projection lens	50mm f/1.2
Projection lamp	24V-250W(ELC) Halogen lamp with cold mirror. High-Normal lamp switch is built-in. Spare lamp storage is provided.
Motor	Induction motor
Film threading	Self-Loading:Film automatically stops after threading through projector (for ease of attaching film to take-up reel).
Automatic loop restorer	Built in
Projection modes	Forward, Reverse and Still projection plus Pause.
High speed rewinding	Reel to Reel
Sound system	Magnetic and Optical playback...16-AL Optical playback...16-AL OPTICAL
Amplifier	All ICs
Music power output	Max. 30W(8Ω)
Continuous power output	25W
Public address	Built-in
Tone control	Built-in
Speaker Aux out	Built-in 12.5cm (5 in.) dynamic speaker. Extension speaker (8 ohm) receptacle is provided. Built-in;(600 ohm MAX 0dB) receptacle is provided.
Remote control	Built-in;Forward, Reverse, Pause, Stop and Lamp On/Off are controllable with the optional remote control with 26 ft. (8m) cord.
Weight	Projector 14kg (31 lbs) [16kg (35 lbs) with front cover]
Dimensions	L15.0 " (38cm)×H12.0 " (30.5cm)×W8.9" (22.5cm) [L15.0" (38cm)×H12.0 " (30.5cm)×W11.3 " (28.5cm) with front cover]

Design and specifications are subject to change without prior notic.

I－3 MAJOR PARTS DESCRITIONS AND FUNCTIONS

I－3－1 FRONT



①Reel lock
The reel locks are to lock the reels on the arm securely.

②Take-up reel arm
The arm is to hold and drive the take-up reel.

③Still projection lever
By setting the lever to "STILL" from "RUN" while normal projection, still projection is possible.

④Folding button for take-up reel arm
By depressing the button, the take-up reel arm can be folded for stowing.

⑤Front cover
The cover is to protect the projector sound and drive mechanism.

⑥Tension roller
The roller is to control the tension on film to be taken up on the take-up reel.

⑦Tone control knob
The knob is to adjust the sound tone. Turning it clockwise allows emphasizing higher tones.

⑧Volume control knob
The knob is to adjust the sound volume.

⑨M-O switch
The switch is to set the projector sound system in accordance with the film to be projected. M position for magnetic sound film and O position for optical sound film. (Not applicable to 16-AL Optical model.)

⑩Feed reel arm
The arm is to hold the feed reel and to drive the feed reel when rewinding.

⑪Folding button for feed reel arm
By depressing it, the feed reel arm can be folded for stowing.

⑫Self-loading lever
The lever is to load the film through projector. When it is depressed, the drive mechanism start running.

⑬Thread slot
The film is to be inserted into it when loading.

⑭Framing knob
When a frame line appears on the screen, turn the framing knob to eliminate the frame line.

⑮Focusing knob
The knob is to adjust the focus of image projected on the screen.

⑯Accessory shoe
The shoe is to attach such an accessory as the Elmo scope lens.

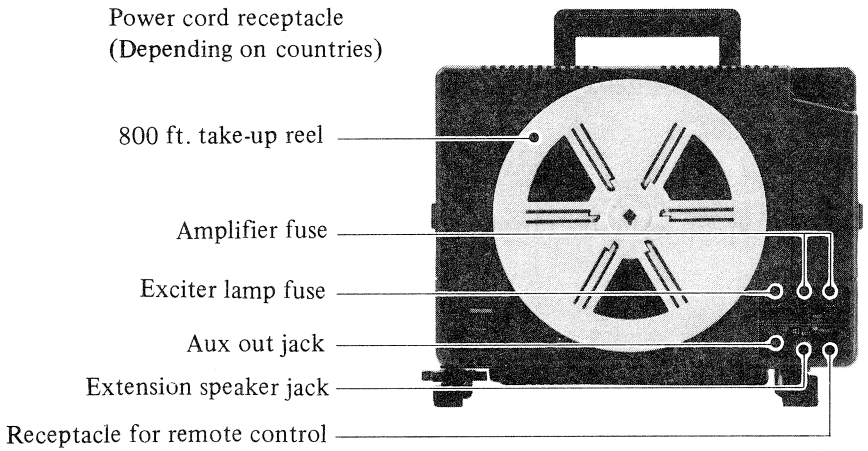
⑰Film trimmer
The trimmer is to trim the leader end to ensure smooth automatic threading.

⑱Operation switch buttons
The buttons are to control the projector functions of Forward/Off/Reverse/Pause modes and Lamp On/Off.

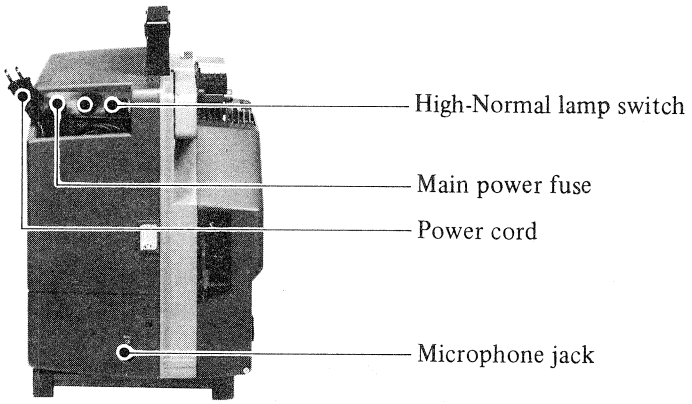
⑲Projector elevation control knob
The knob is to adjust the height of picture.

I－3－2 REAR AND SIDE

Rear



Side



⑳800ft take-up reel
The reel is to take up film.

㉑Amplifier fuse
The fuse is protect the amplifier from excessive current which may flow into the amplifier by accident.

㉒Exciter lamp fuse
The fuse is to protect the exciter lamp from excessive current which may flow into the exciter lamp by accident.

㉓Aux out jack
The jack is to reproduce sound through an external amplifier.

㉔Extension speaker jack
The jack is to connect an external extension speaker. When a plug is connected to the jack, the built-in speaker circuit will be automatically cut off.

㉕Receptacle for remote control
The receptacle is to use the remote control (option).

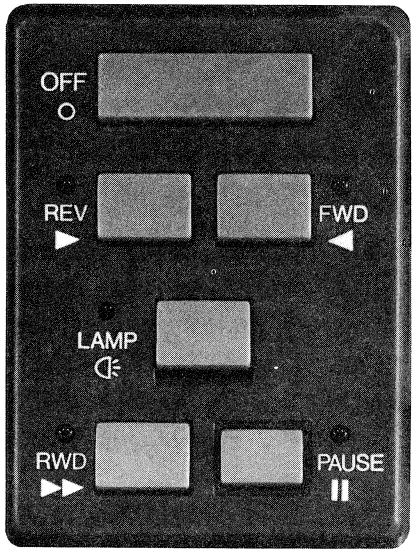
㉖High-Normal lamp switch
The switch is to set the lamp brightness to either normal position for normalimage or high position for brighter image.

㉗Main power fuse
The fuse is to protect the whole projector from excessive current which may flow into the projector by accident.

㉘Power cord
The cord is to supply power to the projector.

㉙Microphone jack
The jack is to connect a microphone for utiliziing for projector as a public address system.

I－3－3 OPERATION SWITCH BUTTONS



(1) OFF O — When the switch is pressed during forward projection/reverse projection/rewiding/pause mode/film loading, the projector stops.

(2) FWD ◀ — When the switch is pressed, the projector runs the film forward and the red LED above the FWD mark comes on. By pressing the forward switch during the reverse projection, direct change of projection mode from reverse to forward is possible.

(3) REV ▶ — When the switch is pressed, the projector runs the film in reverse and the red LED above the REV mark comes on.
By pressing the reverse switch during the forward projection, direct change of projection mode from forward to reverse is possible.

(4) LAMP — The switch is to turn the projection lamp ON or OFF. When the lamp switch is ON, the red LED above the LAMP mark comes on. With the lamp switch ON, the forward (reverse) projection can be done by pressing the forward (reverse) switch.

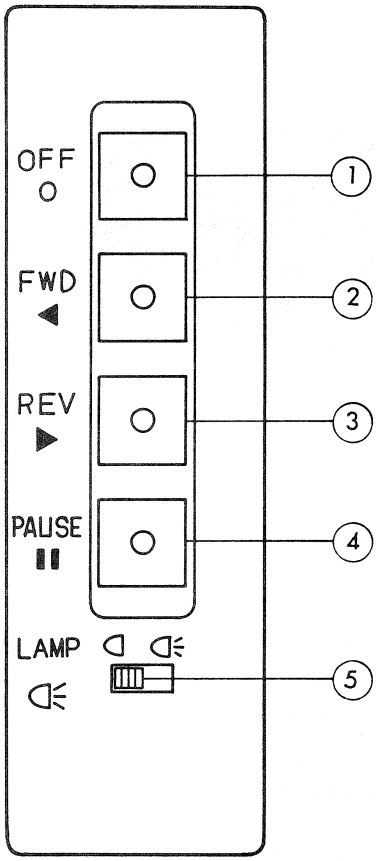
(5) RWD ▶▶ — By pressing the switch, high-speed rewinding of film from the take-up reel to the feed reel is possible. Rewind switch is not operative when the film remains in the film path.

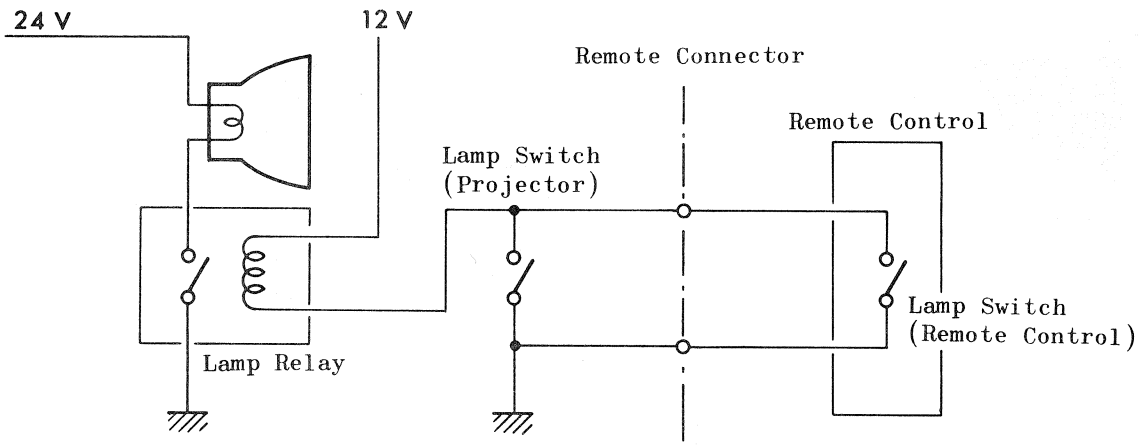
(6) PAUSE ⏸ — The switch is to stop and start the forward projection instantly. When the swetch is pressed during the forward projection, the projector stops running without releasing the film from sprockets on the film path (pause mode) and the red LED above the PAUSE mark comes on. Re-pressing the switch to release the pause mode let the projector re-start the forward projection instantly.
(The pause operation is not applicable to the reverse projection.)

I－3－4 REMOTE CONTROL

The operation procedure of switchs No.①, No. ②, No. ③, and No. ④ is exactly same with that of the operation switch buttons in the projector. (Refer to page 7.)

The switch No.⑤, LAMP is to turn the projection lamp ON or OFF as with the switch button LAMP in the projector, but the lamp switch in the remote control and the lamp switch in the projector are arranged in parallel in the circuit as shown in the following diagram. Therefore, when controlling the projector through the remote control, be sure to turn the lamp switch in the projector OFF.





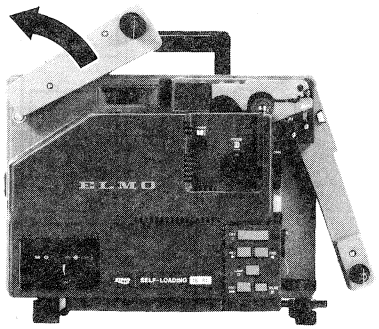
Lamp Switch Circuit

I－4 PREPARATION FOR PROJECTION

(1) Set up the projector and screen properly.
For steady projection, place the projector on a sturdy support at right angle to the screen.

(2) Connect the power cord, which is stored in the top side receptacle of the projector, to the AC electrical outlet.

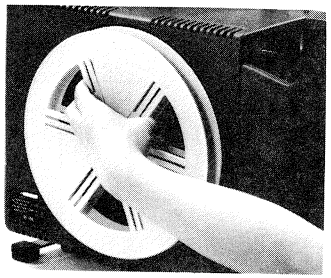
(3) Pull up the feed reel arm and take-up reel arm to maximum stop position.

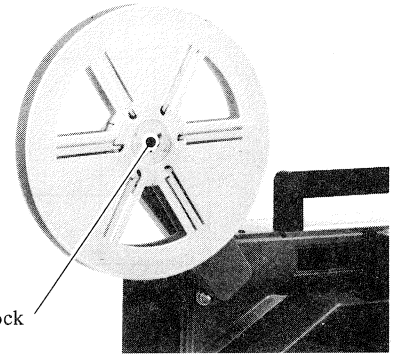


(4) Install the feed reel with film on the feed reel spindle, and turn down the reel lock.

(5) Adjust the height ot picture with the elevation control knob.

(6) Install the supplied take-up reel 240 m (800 ft.),which is stored on the rear of the projector, or an optional reel of more than 240 m (800 ft.) film capacity on the take up reel spindle. At this time, be sure to set the reel in correct position by turning down the reel locks. The reel capacity of the projector is max.720 m (2400 ft.)

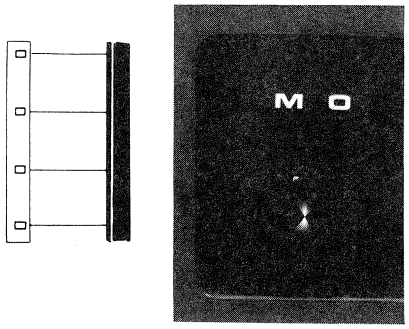




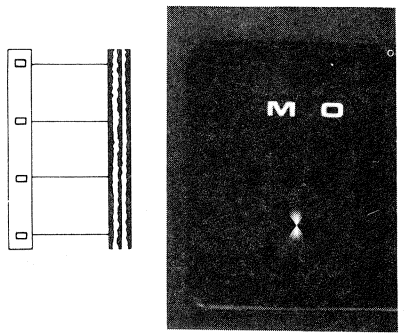
(7) Set the M-O switch in accordance with the film to be projected. Set it to M position for magnetic sound film and O position for optical sound film respectively.

Note: Not applicable to 16-AL Optical model.

Magnetic sound film



Optical sound film

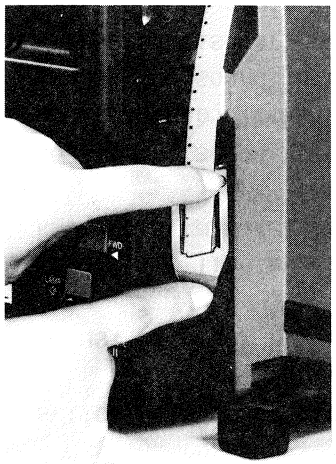


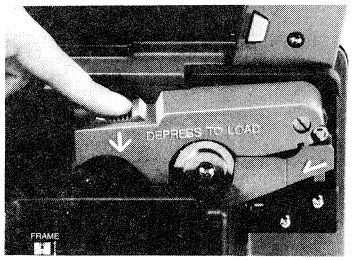
I－5 FILM LOADING

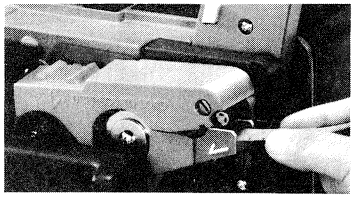
(1) Trim the leader end of the film with the Film Trimmer for smooth, automatic threading. Improper trimming of the film end may result in failure of smooth film threading. In case the film leader (about 1 m in length) is bent or twisted, or perforations are damaged, replace with a new leader or cut off the leader. Be sure to attach a proper lenght of film leader. Adequate leader will ensure smooth thread performance.

(2) Depress the green Self-loading Lever all the way in the arrow direction until it is locked. When it is locked, the motor starts running.

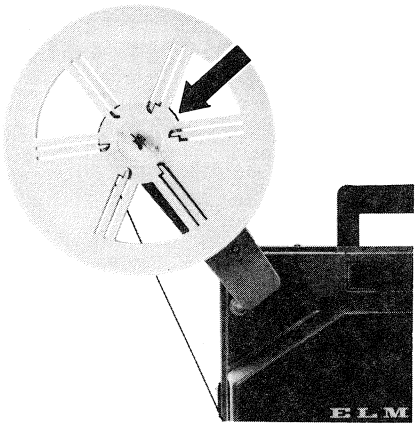
(3) Insetr the film end into the thread slot straight until it is pulled in.





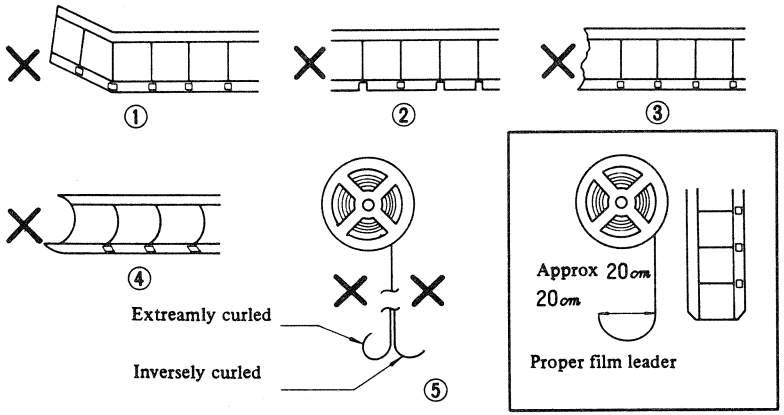


(4) Film automatically stops after threading through projector Wind the leader on the take-up reel.



Note: Check the following in case film fails to be threaded. properly.

① Is the film end bent?
② Are perforation damaged?
③ Is the film end jagged?
④ Is the film end twisted or warped?
⑤ Is the film end extremely curled?



I－6 PROJECTION

(1) Press the forward switch (FWD) and then press the lamp switch (LAMP) for projection.

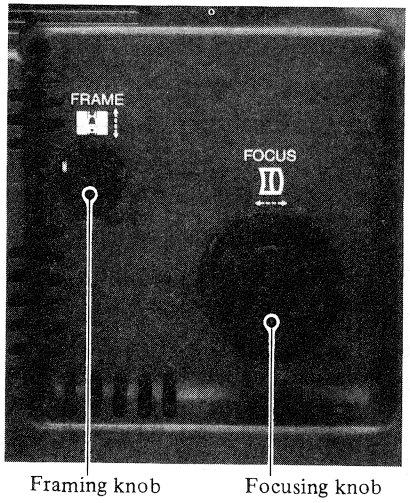
(2) Adjust focusing by turning the focusing knob.

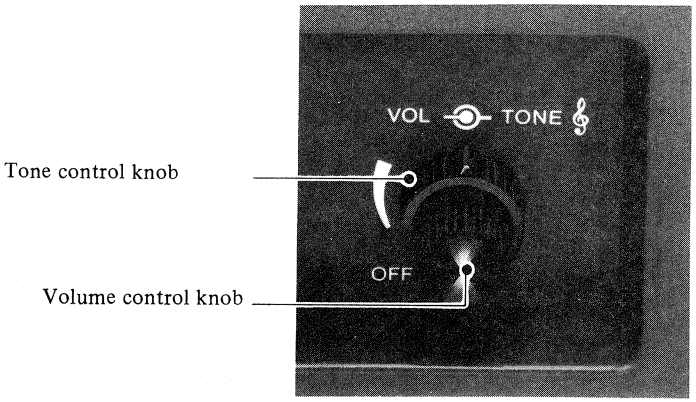
(3) If a frame line appears on the screen, turn the framing knob to eliminate the frame line.

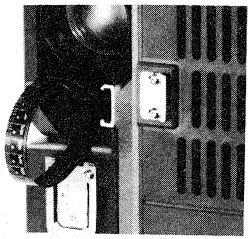
(4) Adjust the sound volume by turning the inner volume control knob clockwise.
Adjust the sound tone by turning the outer tone control knob clockwise or counterclockwise for treble control.
Tone control knob Volume control knob

(5) When the projection is completed, press the off switch (OFF).
(The projector automatically stops when the end of film passes the first sprocket in the film path, and you can take up the entire film onto the take-up reel by hand.)

Note: If the film breakage occurs during projection, a safety mechanism of the projector works to have the broken film getaway from the film path automatically. Press the off switch (OFF), remove the film from the film path and splice the broken film with a splicer.







I－7　VARIOUS PROJECTION

I－7－1　STILL PROJECTION

Set the Still Projection Lever to "STILL" from "RUN".

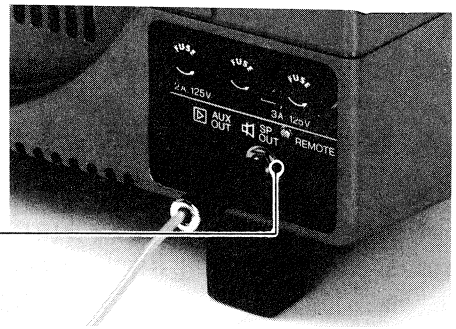
I－7－2　REVERSE PROJECTION

Press the reverse switch (REV), and then press the lamp switch (LAMP) for reverse projection.

I－7－3　WHEN USING EXTENSION SPEAKER

In the event you have occassion to use an optional extension speaker for a large audience in a large auditorium, connect the speaker plug to the extension speaker jack at the rear of the projector. This procedure will automatically shut off the built-in speaker circuit.

Extention speaker jack
(DIN type speaker jack is provided depending on the country)

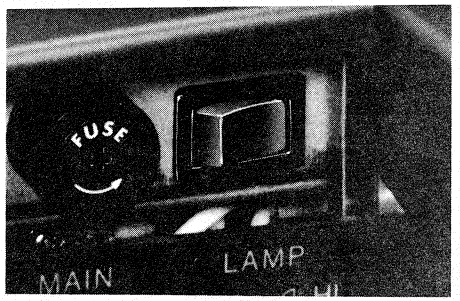


Extention speaker jack

(DIN type speaker jack is provided depending on the country)

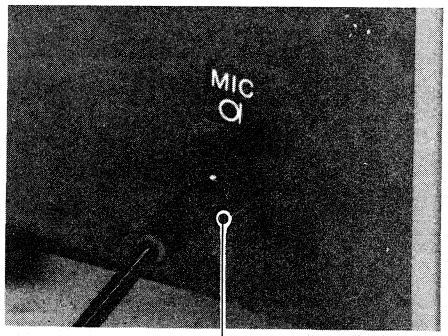
I－7－4　HIGH-NORMAL LAMP SWITCH

The switch is origianlly set to HI(High) position. With the switch set to NORM (Normal), a little lower voltage is applied to the lamp to prolong the lamp service life. When especially bright image is required, set the switch to HI to apply the rated voltage to the lamp.



I－7－5　PUBLIC ADDRESS SYSTEM

You can utilize the projector as a public address system during projection when an optional microphone is connected to the microphone jack at the rear left side of the projector. Use the microphone with an impedance of 500 Ω～10K Ω. Public address through a microphone during projection supersedes the sound from the projected film.

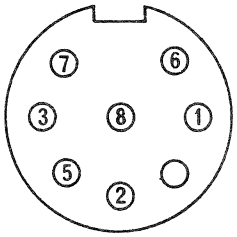


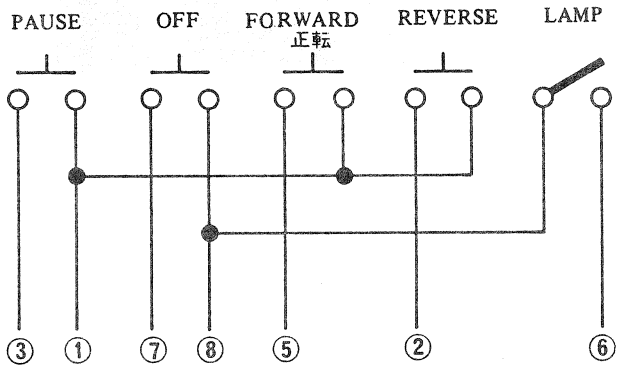
Microphone jack

I－7－6 REMOTE CONTROL

DIN 8P remote control receptacle is provided, and remote control operation is possible by connecting the Remote Control (Option) to this receptacle.

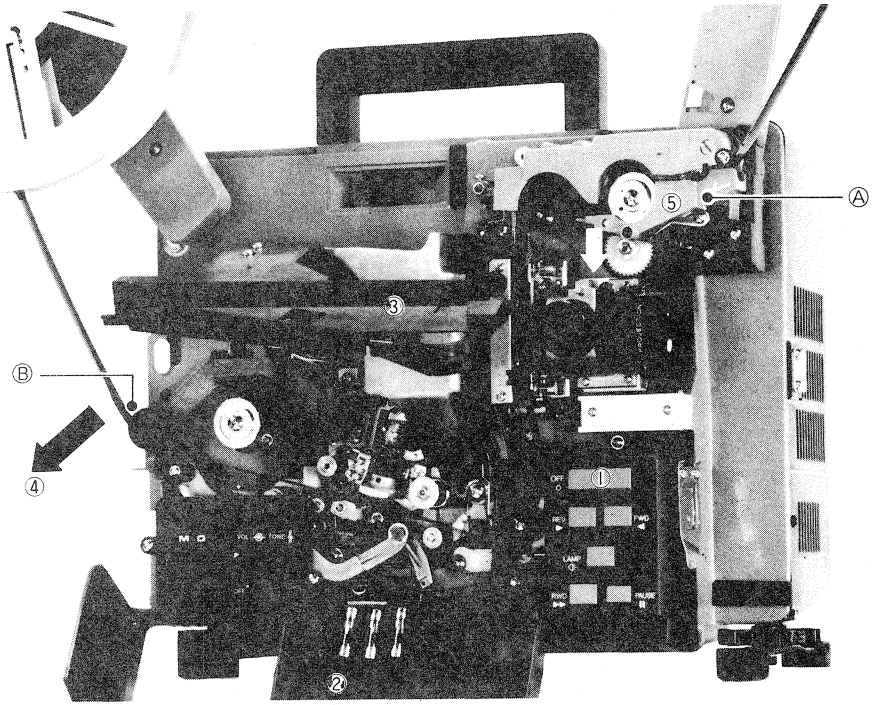
The schematic diagram below shows the remote cord connections.





I－8 REMOVING THE FILM DURING MIDWAY PROJECTION

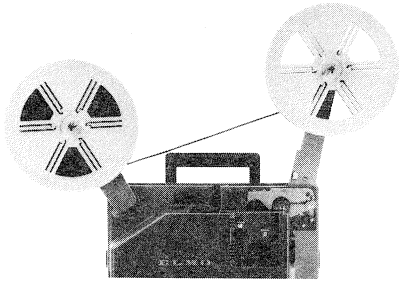
(1) Press the off switch (OFF) to stop the projector.
(2) Open the front cover.
(3) Open the auto-thread guide.
(4) Remove the film, pressing the tension roller (B) upward.
(5) Remove the film, pressing the first sprocket shoe (A) downward.



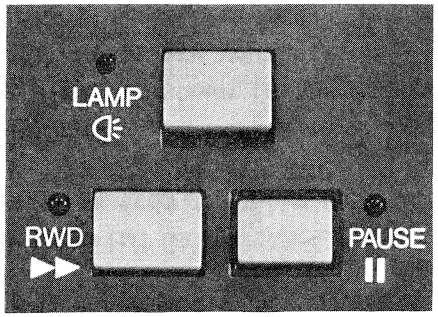
I－9 REWINDING

● When the projection is completed, rewind the film as follows.

(1) Insert the film end into the slot of the feed reel hub.



(2) Press the rewind switch (RWD)
In this case the projector may start rewinding only after a few seconds' pause depending on the length of film on the reel to be rewound. The projector is designed to increase rewinding torque gradually for the protection of film.

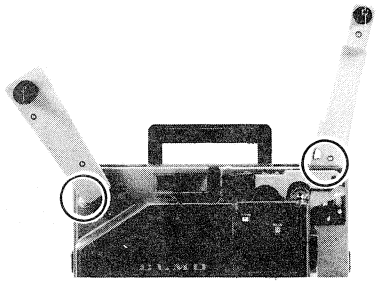


(3) After the film is fully rewound, press the off switch(OFF).

(4) Remove the reels from the feed reel and take-up reel arms.

I－10 STOWING

Disconnent the power cord first.



(1) Fold the feed reel and take-up reel arms by depressing the folding buttons.

(2) Return power cord and take-up reel to their stowing receptacles.

(3) Turn the elevation control knob fully counterclockwise. Never transport the projectror with the elevation leg extended.

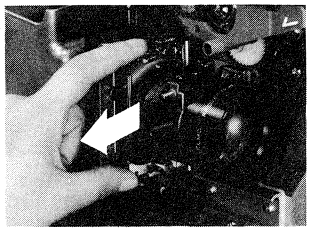
I－11 MAINTENANCE

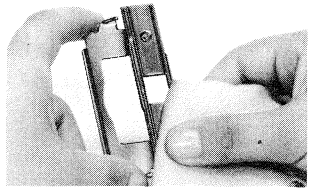
Clean the film path and lens prior to projection;accumulation of dust and film particles in the film gate will scratch the film and decrease the projected image quality. Open the front cover for cleaning.

I－11－1 CLEANING FILM GATE

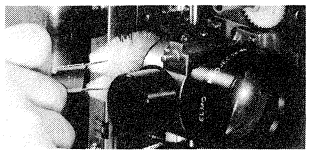
Be sure remove the film from the film path when cleaning the film gate.

Hold the pressure plate as shown in the picture and pull it out toward yourself, and the pressure plate can be removed.

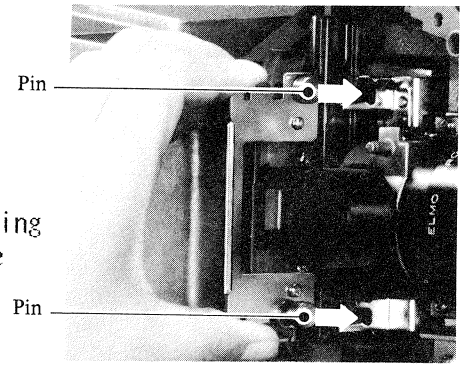




Use the stiff cleaning brush (supplied) to clean film gate, then wipe clean with lint-free cloth.



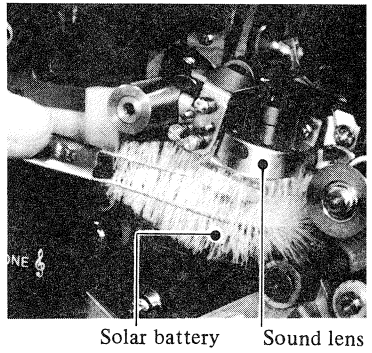
After the cleaning is over, align the two pins at the upper and lower patrs of the pressure plate holder with the corresponding slots on the pressure plate base and push it back to place.



I－11－2 CLEANING SOLAR BATTERY AND LENS

Brush off the rollers, solar battery and sound lens with the brush supplied.

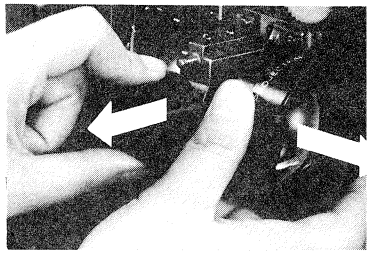
Note: If a dust adheres to sound lens or solar battery, the tone quality or volume will be decreased.



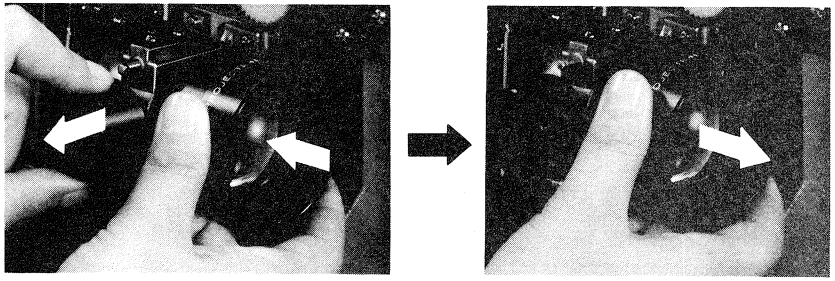
I－11－3 CLEANING PROJECTION LENS

To remove the projection lens, pull it out straight while pulling the focusing knob toward yourself.

To remove the dust, wipe the lens surface gently with soft, clean, lint-free cloth.



To put the lens back, push it all the way to position while pulling the focusing knob toward yourself, and pull it until a click is heard. This click sound means that the pin at the end of the focusing knob is positively inserted into the groove of the lens holder.



Make sure the lens can move back and forth smoothly by turning the focusing knob.

I－12 REPLACING LAMP AND FUSE

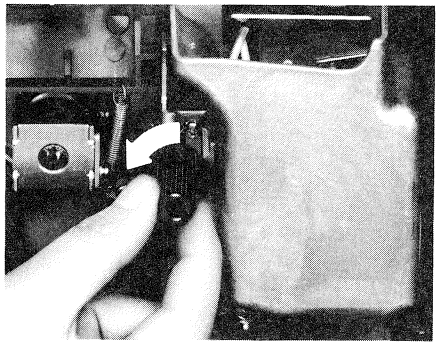
BE SURE TO DISCONNECT THE POWER CORD WHEN REPLACING LANP AND FUSE.

I－12－1 REPLACING PROJECTION LAMP

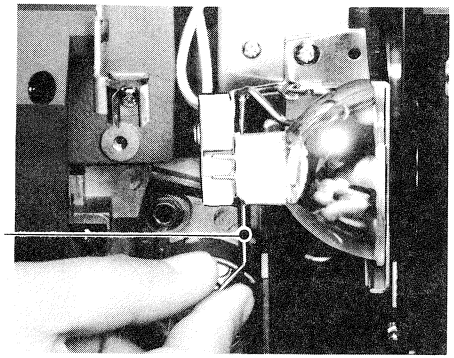
The type of projection lamp to be used is JCR24V-250W or ANSI ELC or Osram 64653.

(1) Open the front cover.

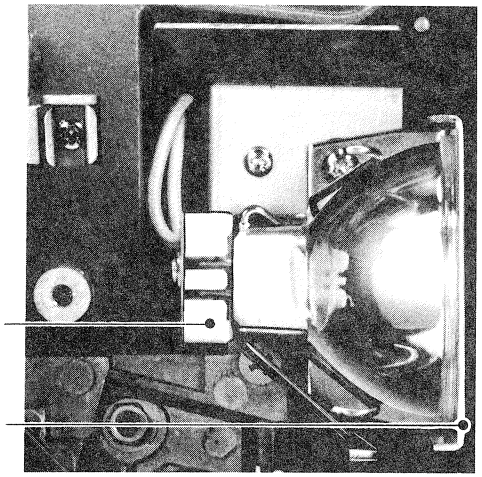
(2) Remove the lamp cover by loosening the screw.



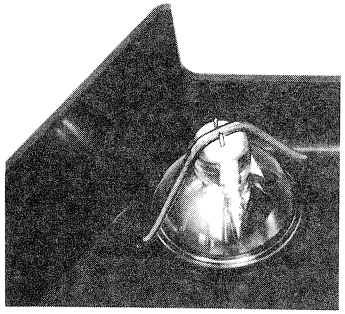
(3) Eject the blown lamp by pushing down the eject lever to the left.



(4) To put a new lamp, push it into the socket as ahown in the picture. At this time, be sure to insert the lamp firmly into its socket. if it is inserted halfway into the socket, the optimum projection performance can't be achieved or the socket may be burned out.



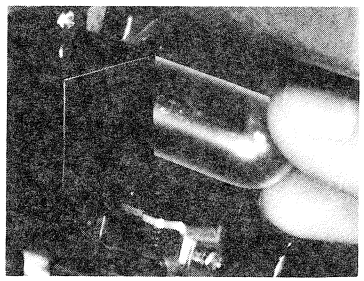
It is advisable to keep a spare projection lamp handy for immediate replacement, should an unexpected break or burn-out develops during projection. A spare projection lamp can be stored on the back side of the front cover.



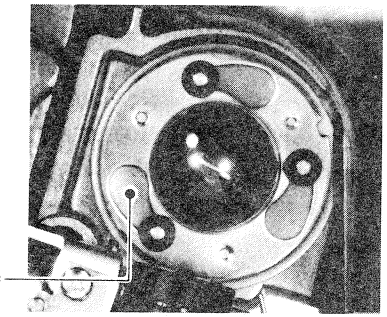
I－12－2 REPLACING EXCITER LANP

The type of exciter lamp to be used is KE-040 or ANSI BRK.

(1) Remove the blown exciter lamp by turning its head counterclockwise.



(2) To put the new exciter lamp, align the three prongs on the socket with the holes on the lamp flange and turn the lamp head clockwise until it locks into place.

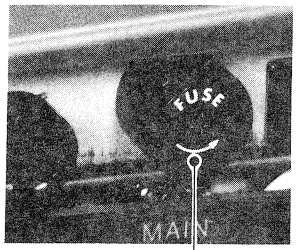


Hole on the lamp flange

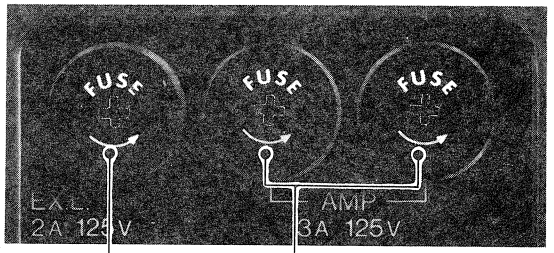
I－12－3 REPLACING FUSE

To remove the fuse holders, turn the holder heads counterclockwise with a Philips head screwdriver.

IMPORTANT
Use the fuse with specified value for each of the three as indicated.



Power (main) fuse



Exciter lamp fuse

Amplifier fuse

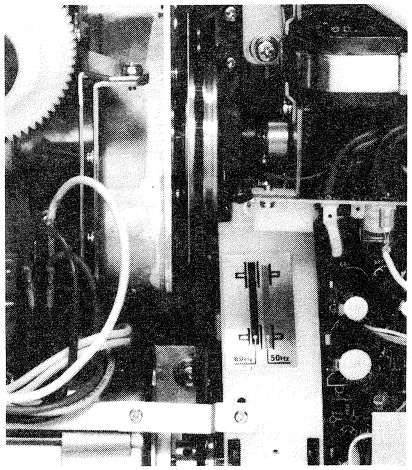
- Check the exciter lamp fuse for blowout when no sound is reproduced with optical sound film. At this time, be sure also to check the exciter lamp filament for blowout.

- Check the amplifier fuse for blowout when no sound is reproduced with either magnetic or optical film.

- When the power (main) fuse is blown out, no power is supplied to any part of the projector. Check the power (main) fuse for failure when the projector does not operate even with the power cord properly connected and the forward switch (FWD) pressed.

I－13 WHEN CHANGING THE PROJECTION SPEED FROM 24FPS TO 18 FPS OR TO CHANGE ELECTRIC CURRENT CYCLES (50Hz-60Hz)

- For 50 Hz, 24/18 fps model:The projector is originally fixed for 24 fps. operation. To change to 18 fps., remove the rear cover by loosening four screws and change the projection speed as shown in the picture.
- For 50/60Hz, 24 fps model:Electric current cycles of the projector are adjusted to either 60Hz or 50Hz at the factory for specific destined countries.
  But to change electric current cycles (50Hz～60Hz),remove the rear cover by loosening four screws and change the belt position as indicated.



Note: One belt is utilized to change electric cycles or projection film speed. When belt is used to change electric current cycles, the same belt cannot be used for change of film speed - or vice versa. The power cord should be detached from electric outlet WITHOUT FAIL, before removing rear cover.

I－14 WHEN CHANGING VOLTAGE

When changing voltage, the power cord should be detached from electric outlet － WITHOUT FAIL

After removing rear cover, take out the connection wire and plug it into the indicated voltage terminal to be used. There is a single voltage model projector available to comply with electrical regulations in specific countries. For this model the above instructions are not applicable.

I－15 TROUBLE- SHOOTING HINTS

WHEN THE MOTOR FAILS TO OPERATE:

- Check the power cord for proper connection.
- Check the power (main) fuse for blowout.

WHEN THE LAMP IS NOT LIT ON:

- Check the lamp filament for bolwout.
- Check the lamp for proper connection with its socket.

WHEN NO SOUND IS REPRODUCED:

- Check the volume control knob if turned clockwise.
- Check the M-O switch for the correct position corresponding to the type of film used (magnetic or optical sound). (Not applicable to 16-AL Optical)
- Check the exciter lamp if lit. (only in case of optical sound film)
- Check the exciter lamp fuse for blowout.
- Check the amplifier fuse for blowout.
- Check if a dust adheres to sound lens or solar battery.

WHEN THE IMAGE CAN'T BE PROPERLY FOCUSED:

- Check the projection lens for correct alignment, with the pin at the rear of the focusing knob, with the groove in the projection lens.

WHEN THE LOOP RESTORER OPERATES CONTINUOUSLY DURING PROJECTION:

- This may reault from the damaged perforations of several frames, which make the slack length of the film between the two sprockets so short that no loop can be restored. In such a problem, press the off switch (OFF) to stop the projector and press the forward switch (FWD) again.

Fig.1

Ⅱ DRIVING MECHANISM

Ⅱ－1 Driving Mechanism Functions

Ⅱ-1-1 Self-Loading Mechanism

When the loop former ⑥ is pushed down, the microswitch ⑧ gets pressed, turning the switch to ON.

↓

The solenoid ② activates, causing the film guide ③ to be drawn to the base frame and turning the microswitch ① to ON.

→ The motor ㉒ starts, setting the feed unit assy ㉕ to start through the V belt main ㉑.

↓

The solenoid ⑰ functions to activate the lock assy loop former ⑯, forming the film path by locking the loop former ⑥.

The worm 1 ㉓ →worm gear (1) assy ㉔ →gear 1st sprockets ㉖, (26a) start rotating, causing the first sprocket ⑫ to rotate.

The middle shaft (2) assy ⑲→ worm 2 ⑲ →worm gear (2) assy ⑳ start rotating, causing the second sprocket ④ to rotate.

↓

Film is inserted.

↓

Driven by the first sprocket ⑫, the film is sent off from the main body through the loop former ⑥→aperture plate ⑩→pressure plate assy ⑪→ film guide ③, and when the film extends out from 70cm to 1m, the self-loading automatically gets released (cancelled).

↓

☆ In order to interrupt the self-loading state in the middle, depress the operation button OFF, which then releases the loop former and brings the motor to a stop.

☆ The self-loading does not operate even by depressing the loop former when the operation switch unit is functioning.

• This machine is equipped in the front of the first sprocket ⑫ with fixed roller film loading ⑨ and sensor roller film loading ⑮. The microswitch ⑦ gets activated when the film passes through these rollers. Furthermore, this microswitch works as a timer switch at self-loading, and releases the self-loading state when the film extends out from 70cm to 1m from the main body. This also works as an auto stop switch at the time of forward/reverse projection.

Fig. 2

Ⅱ-1-2 From Forward Projection to Stop Mechanism

When the operation button FWD is pressed, the switch ① turns to ON, starting the cam motor ② and rotating the worm remote ③ and gear (1) remote ④, and then causing the opration cam ⑤ to rotate.

The link (1) ⑥ touches the cam unit of the operation cam ⑤, and starts shifting as the cam rotates.

The opration cam ⑤ continues rotating, and presses the microswitch ⑦ at each rotation (turn), bringing the cam motor ② to a stop.

At projection the cam face of the operation cam ⑤ is most widely apart from the link (1) ⑥.

The link (2) sprocket shoe (2) ⑧ rotates, shifting the link (1) guide roller (2) ⑨ downward, and presses the pressure plate ⑫ closely against the aperture plate ⑬ by pushing the spring holder (1) ⑪ with B portion as the A portion of ⑨ departs from the holder (2) pressure plate ⑩ Furthermore, the holders assy link (1) ⑭ linked to ⑨ pushes the stop lever guide roller (2) ⑮ to release (set free) the guide roller (2) ⑯ from the loop forming position.

The select lever ⑰ gets pressed, activating the reverse lever ⑱.

The lever brake roller (2) ⑲ gets pressed, bringing the brake roller (2) assy ⑳ in close contact to the brake roller (3) assy ㉑.

The second sprocket presser ㉗ is set.

The lever pressure roller ㉒ is activated to bring the pad roller assy ㉓ in colse contact to the shaft flywheel assy ㉔, and then the lever middle tension ㉕ and lever assy photo diode ㉖ are activated for bringing to projecting position.

The lever guide roller (3) ㉘ is unlocked by moving the lock plate guide roller (3) ㉗.

The microswitch ㉙ is pressed when the link (1) ⑥ has shifted to the vicinity of its end point for turning the switch to ON.

The main motor starts and rotates the sprockets ㉚ and ㉛ and the resr reel shaft.

The solenoid ㉜ activates to lock the roller link lock ㉟ with the lock plate link (1) ㉞ connected to the link lock plate ㉝.

The lever guide roller (3) ㉘ and the guide roller (2) ⑯ are the rollers for securing the loops above and below the film gate, and the timing is delayed so that the rollers activate only after the film gets engaged to the second sprocket ㉛.

Stop Function:

On depressing the operation button OFF or turning the power to OFF, the power to the solenoid ㉜ is cut off, disconnecting the lock plate link (1) ㉞ by means of the tension of spring guide roller (3) ㊲ applied to the solenoid ㊱. Then the link (1) ⑥ returns to the original position due to the tension of spring tension roller ㊳ applied to reverse lever ⑱ and the tension of spring guide roller (3) ㊴ applied to lever second sprocket presser, returning each roller to the OFF position.

II-1-3 Reverse Projection Mechanism

On depressing the operation button REV, the switch ㊵ turns to ON, which sets the cam motor ② to start, and the machine to continue operation for forward projection until the link (1) ⑥ activates.

↓

On turning the switch ㊵ to ON, the solenoid ㊶ activates to disconnect the select lever ⑰ from the link (1) ⑥ (for approximately 2 seconds) setting the reverse lever ⑱ to OFF position and, accordingly, causing no function related to reverse lever ⑱ (see "Forward Projection Mechanism" on page 22) to be carried out.

↓

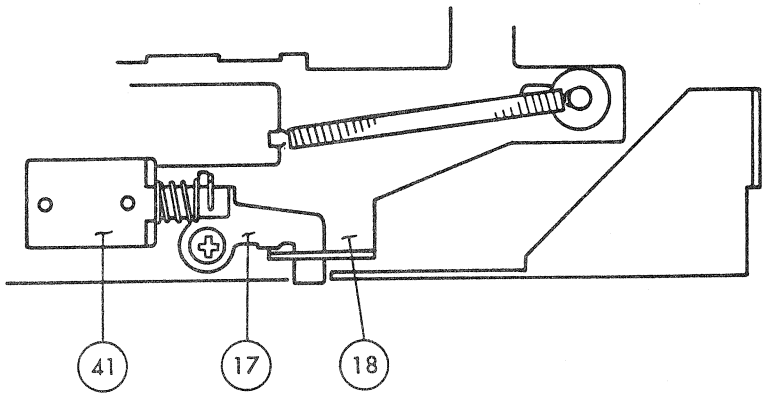
The switch is turned to ON by depressing the microswitch ㉙ when the link (1) ⑥ has shifted to the vicinity of its end point.

↓

The main motor then starts in reverse direction to rotate the front arm reel shaft.

↓

Other mechanisms are the same as in the case of Forward Projection Mechanism.



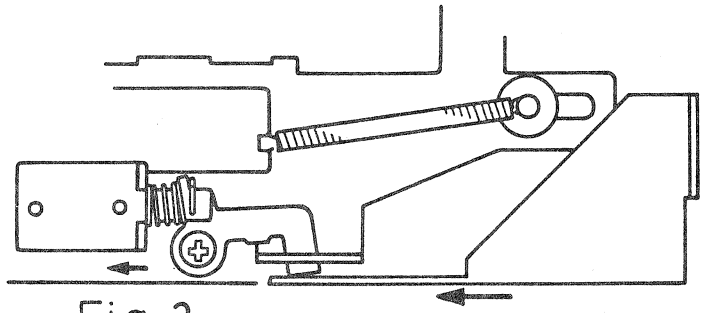


Fig.3

II-1-4 Film Take-up Mechanism

The film is taken up, as shown in Fig. 4, by turning the main motor ①→claw section frame assy ②→middle shaft (2) assy ③→worm (2) ④→worm gear (2) assy ⑤→pulley (2) assy take-up ⑥→pulley shaft take-up ⑦→belt ⑧→pulley (2) upper take-up ⑨, and rotating the reel.

The pulley (2) assy take-up ⑥ has roller clutch press-fit at the bearing to transmit the rotation in only one direction (of take-up).

Refer to "Disassembly, Reassembly and Adjustment" on page 36 for the take-up tension.

Fig.5

Ⅱ-1-5 Film Rewinding Mechanism

A: Take-up at Reverse Projection

The film is rewound by means of the transmission of rotation from main motor ① to reel shaft assy rewind ⑫ through claw section frame assy ⑥, worm (1), worm gear (1) assy ⑦, gear (1) assy rewind ②, middle gear rewind ④, gear (2) rewind ⑤, pulley shaft rewind ⑨, STS belt ⑩ and sync. pulley rewind ⑪.

The rewind tension at reverse projection is adjusted by means of the tensional pressure of spring reverse tension ③ in the tension mechanism in Fig. 5.
Needless to say that the rewind tension is also largely influenced by the gears succeeding the tension mechanism and the load such as the tension of the belt ⑪ in the front arm, etc..
Refer to "Disassembly, Reassembly and Adjustment" on page 36 for rewind tension at reverse projection.

B: Reel-to-reel Rewinding

The rotational mechanism from the main motor is the same as at the reverse projection. However, in order to carry out high speed rewinding, the magnetic clutch ⑮ is activated to nullify the above mentioned tension mechanism.

Depress the operation switch RWD.

↓

Carry out reverse projection rewinding for approximately 2 seconds in order to avoid exerting large load onto the film.

↓

The magnetic clutch ⑮ activates after approximately 2 secpnds, causing ⑬ to be drawn to ⑭ and the gear (1) assy rewind ② to be fixed to the shaft reverse tension ⑯, making it impossible for the tension mechanism to function.

↓

The next procedures are the same as in the case of reverse projection.

II－1 Driving Mechanism Functions

II-1-6 Safety Mechanism

The rotation from drive motor is transmitted to triangle cam shaft assy ⑤ through pulley shutter ①, pulley (1) clutch ②, pulley (2) clutch ③ and boss pulley (2) clutch ④.

Set the knob still projection ⑥ to STILL.

↓

The power is then transmitted from the select lever still proj. ⑦ to click spring ⑧, lever (1) assy clutch mover ⑨ and lever (2) assy clutch mover⑩, and since the pins caulked at the ends of ⑨ and ⑩ are fitted to the groove of pulley (2) clutch ③, the pulley (2) clutch ③ sides over the boss pullty (2) clutch ④ to disconnect the engagement with the pulley (1) clutch ②. With the transmission of rotation from the motor being as shown above. the disconnection of ② and ③ causes the tramsission of rotation to the triangle cam shaft assy ⑤ to stop. meaning thereupon that the claw section frame assy stops functioning. making the film feeding impossible. Needless to say that the first as second sprockets also stop functioning.

↓

If the film stops this way, it may get burned due to the heat of projection lamp and the heat resisting glass is inserted in the following manner.

↓

The operation is made in the order of select lever still proj. ⑦→lever (1) assy still proj. ⑪→lever (2) assy still proj. ⑫→safety shutter assy ⑬ (heat resisting glass)

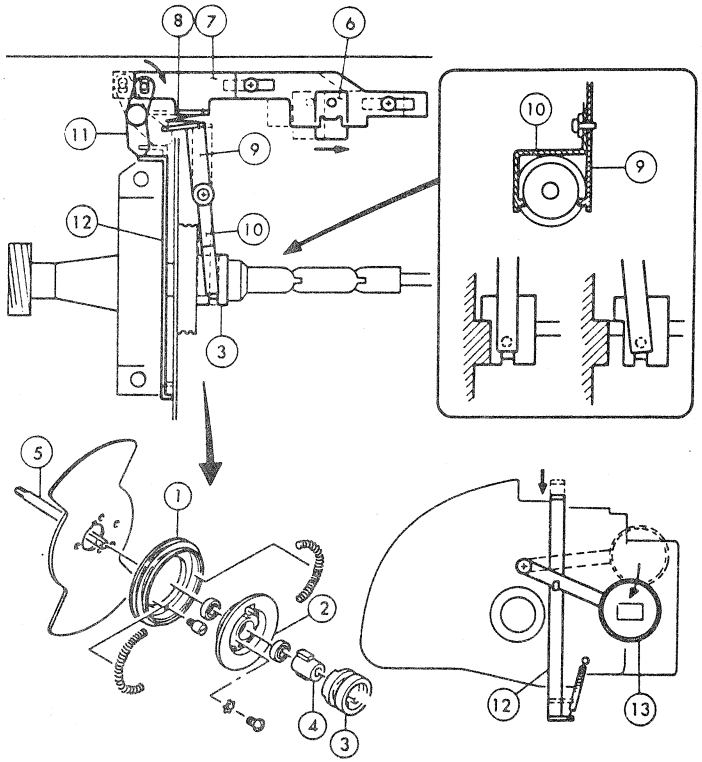

Fig.6

II-1-7　Automatic Loop Restorer Mechanism

The automatic loop restorer activates to secure proper loop when the film loop under the film gate, at forward projection, gets small due to misfeeding resulting in the damage to performation, etc. However, this loop restorer does not function for the loop above (at the top of) the film gate or for the loop at reverse projection.

When the loop gets small, the film pushes up the link (2) loop setter assy ① to rotate the holder link (2) assy ②.

↓

This pushes up the lever (1) loop setter assy ③, coaxially interlocked with ②, disconnecting the claw fitted to the friction wheel (2) ④.

↓

The friction wheel (2) ④ then touches the rubber roller of worm gear (1) assy ⑥ due to the tensional pressure (spring tension) of spring loop setter ⑤.

↓

Since the worm gear (1) ⑥ is rotating, the knurled part of friction wheel (2) ④ cuts into into the rubber roller, causing ④ to rotate.

↓

The link (1) loop setter⑦ aligned to friction wheel (2) ④ shifts downward to push down the lever guide roller (3) ⑧, and accordingly the guide roller (1) ⑨ installed on ⑧ pushes down the film to secure appropriate loop.

↓

The friction wheel (2) ④ then fits with the claw of ③ and stops after taking one turn.

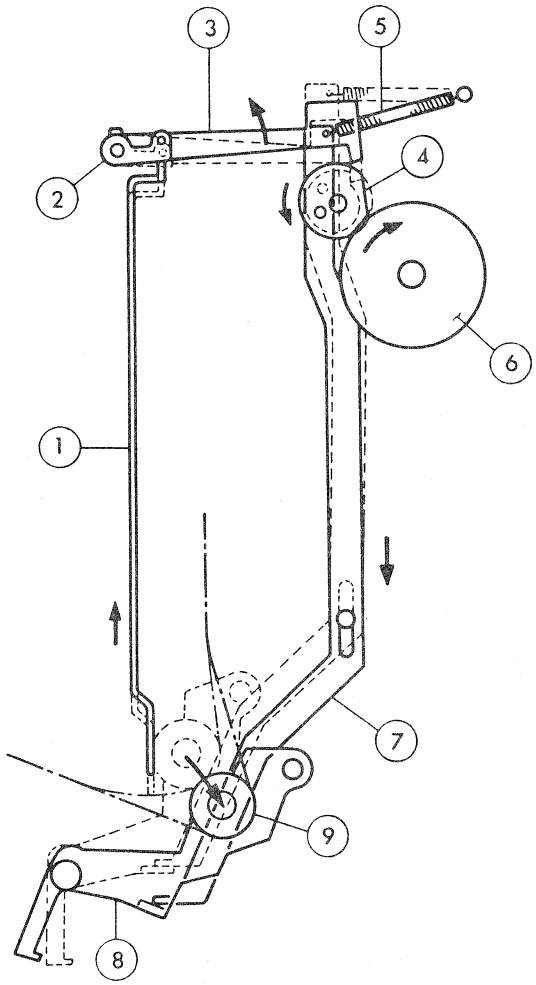

Fig.7

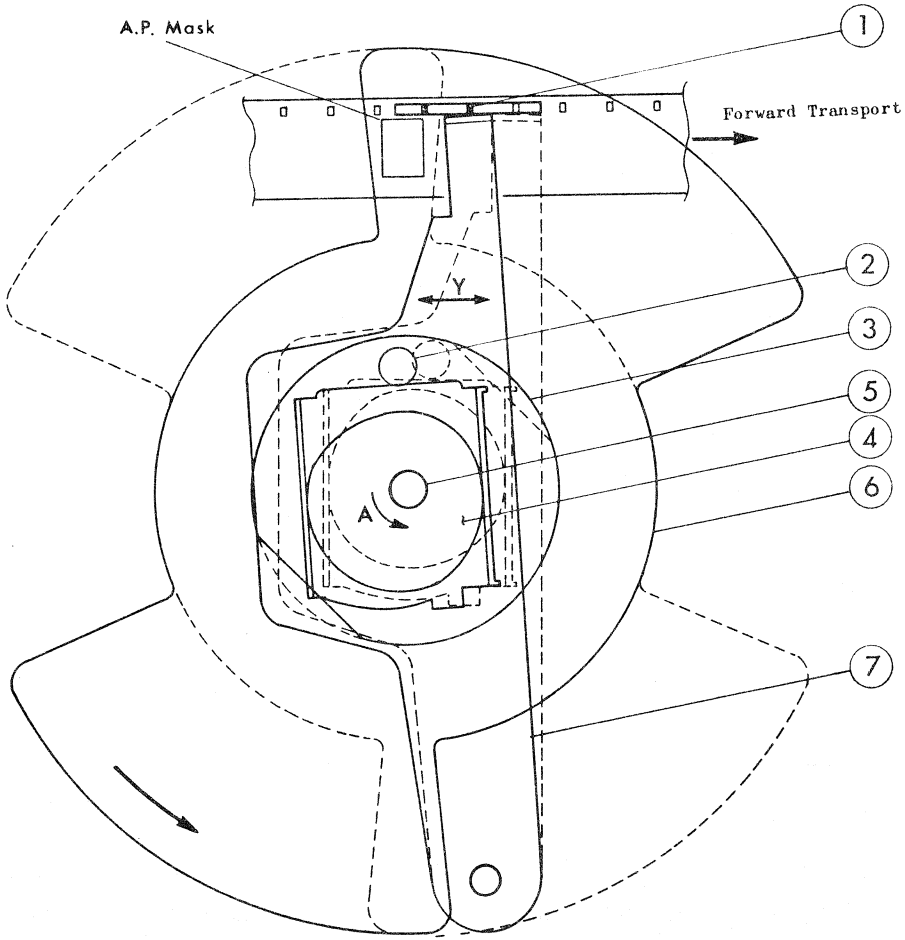

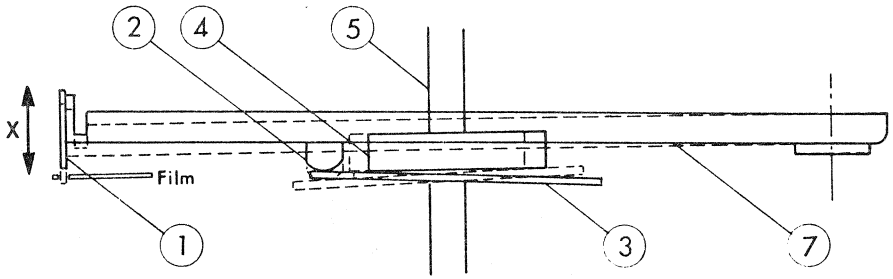

Fig.8

Ⅱ-1-8 Intermittent Film Feeding Mechanism

The rotation from motor is transmitted to the triangle cam shaft assy ⑤, starting the film feeding mechanism to rotate (in the arrow mark[A]direction at forward projection).

The triangle cam ④ installed in the triangle cam shaft assy ⑤ rotates.

Since the triangle cam ④ is internally contacted with claw (1) assy ⑦, ⑦ functions in arrow mark[Y]direction when ④ rotates.

The face cam ③ installed in the triangle cam shaft assy ⑤ rotates.

Since the claw pin ② attached to claw (1) assy ⑦ is closely contacted with the triangle cam shaft assy ⑤, ⑦ funcrions in arrow mark[X]direction when ⑤ rotates.

The shutter ⑥ is installed so as to block the aperture mask when claw (1) assy ⑦ functions in arrow mark[Y] direction.

When the claw (1) assy ⑦ functions in arrow mark[X]and [Y]directions, the claw ① installed in ⑦ functions symmetrically to feed the film.

The relation among claw ①, triangle cam ④, face cam ③ and shutter ⑥ is shown in Fig. 9.
a: Back feed part b: Film feed part c: Shutter angle closing part

Ⅱ－2 Disassembly and Reassembly

Ⅱ-2-1 Film Thread Slot Section
Loop former assy ②, Shoe first sprocket ⑬

Hints for Trouble-shooting

Trouble symptom	Cause
Self-loading mechanism fails to function (motor does not rotate).	Defective ⑧ or inadequate fitting position.
Failure in upkeeping of self-loading state (i.e. the loop former assy can not be locked.)	Disconnection of ㉕
Self-loading mechanism continues operating.	Inadequate fitting position of ⑧, defective ⑥
Auto stop does not activate at self-loading.	Defective ⑨ or inadequate fitting position
Auto stop does not activate at forward/reverse projection.	Defective ⑨ or inadequate fitting position
Scratch (flaw) of film	Uneven rotation of ⑩, ⑪, ⑯ and ⑰, flaw and abrasion of ⑬

Disassembly

1. Remove the back cover.
2. Take out ⑤ from the terminal plate at the back of the built-in speaker.
3. Remove ①, and then ② by rotating in the direction of arrow mark.
4. Unscrew 2 pieces of screws ④, and remeve ③ by spreading ⑬ downward.
5. Unscrew 1 piece of screw 28; ⑬ and ⑪ x 2 can then be removed simultaneously.
6. For further disassembly, refer to Fig. 10.

Reassembly

1. Carry out reassembly in the reverse order of disassembly, making sure that rollers and roller shafts are free from flaws, and that the rollers have smooth rotation.
2. Make sure that the lever ⑱ functions lightly and turns switch ⑨ to ON when film is loaded between ⑩ and ⑰, and returns to its original position only due to the dynamical stability of switch ⑨ when the film is removed. (See Fig.11.)
3. Firmly tighten the screw ①, and make sure that ② moves lightly.
4. Adjust the fitting position of switch ⑧ so that the switch turns to ON when ② is pushed down and to OFF when released. Futrhermore, when the presser ② is released, see to it that ② returns due to the tensional pressure of ⑥ till it touches the stopper ㉖ as A-part in Fig. 12. In case ② does not return, adjust by bending ⑥.
5. Install ㉔ connecting plunger ㉕ to ㉓ in the durection of arrow mark in Fig. 10.
6. Be careful so as not to mix up by mistake the 2 pieces of screws ④ and the screw ㉗.

Ⅱ－2 Disassembly and Reassembly

Ⅱ-2-2 Operation Switch Buttons Section
Mode switch ⑫, Cam motor assy ㉓

Hints for Trouble-shooting

Trouble symptom	Cause
Failure in forward projection	Defective ⑭ or/and cord disconnection and inadequate contact of ⑮ and ⑯
Failure in reverse projection	Defective ⑧ or/and cord disconnection and inadequate contact of ⑮ and ⑯
Failure in high speed rewinding	Defective ⑩ or/and 〃
Failure in pause mechanism	Defective ⑪ or/and 〃
Lamp does not light up.	Defective ⑨ or/and 〃
Mechanism unit does not set to projection.	Defective ㉓ or/and 〃
Cam motor ㉓ does not stop.	Defective ⑰ and inadequate fitting position

Disassembly

1. Remove ② by unscrewing 2 pieces of screws ①.
2. Pull out connector ⑯.
3. Unscrew 2 pieces of screws ③ as well as screw ④.
4. Lift ㉕ up with your finger as shown in Fig. 14, and move link (1) ㉖ to projecting position, then unscrew the screw ⑤ to remove ⑥.
5. For further disassembly refer to Fig. 13.

Reassembly

1. Carry out reassembly in the rverse order of disassembly, making sure that the gear units ⑲ and ⑳, cam units and shafts have no scratches (flaws), burrs, etc. and have light and smooth rotation.
2. When replacing the cam motor ㉓, ㉑ must be attached anew to the new cam motor. Since the ㉑ is attached to the shaft of ㉓ by means of adhesive (lock tight) and screw ㉒, remove the ㉑ by loosening the screw ㉒ and melting the adhesive by applying heat. For attaching ㉑ anew, apply adhesive to the shaft of ㉓ with the ㉑ kept at lowered position as shown in the left-hand-side of Fig. 15, then raise the ㉑ to the position shown in the right-hand-side of Fig. 15, and tihgten the screw ㉒ firmly after applying screw lock.
3. Install the switch ⑰ so that it turns to ON/OFF due to the cam face ⑳ marked with oblique line in Fig. 16.
4. When inserting ⑥ into the base frame, see to it that the A-part of ㉔ is closely contacted with the base frame.

Fig.18

Ⅱ-2-3 Film Take-up and Rewinding Section

Rewind arm assy ⑤

Hints for Trouble-shooting.

Trouble symptom	Cause
Failure in rewinding	Weak tension of ⑩, broken gear units ⑯ and ⑱
Rewind arm can not be fixed	Worn-out ④ and ㉒
Film droops at forward projection	Inadequate tension of ⑳, excessively weak tension of ⑮)

Disassembly

1. Remove the back cover.
2. Remove the film thread slot section. (Refer to page 32.)
3. Remeve the E ring ⑥ and take out ⑦.
4. Remove ② by unscrewing the screw ①, and then take out ⑤. (Here, take care since ③ and ④ may fly out.)
5. For further disassembly refer to Fig. 17.

Reassembly

1. Carry out reassembly in the reverse order of disassembly.
2. Disengage the belt ⑳ to make sure that ㉓ has even and smooth rotation. Change the bearing ㉑ if there is unevenness in rotation. Confirm ⑯ alse in the same manner.
3. Since ④ inserts into the dent ㉒ to fix ⑤ at projecting position, be sure to replace ④ and ㉒ when they get worn out.
4. Adjust the tension of ⑳ at fitting position of ⑰ so that the film may not droop when the projector is stopped at or during forward projection. The spring ⑮ is also for preventing the film from drooping.
5. Measure the rewinding tension.
   Measuring method: Draw the spring balancer (P048) in the direction of arrow mark at reverse projection state, referring to Fig. 18.
   Permissible range: 200 ～300g
   Adjusting method: Adjust the tension of ⑩ by means of the tightness of ⑨, and fix ⑥ with ⑧ after the tension reaches the permissible range.

Caution: In order to prevent static electricity due to reel, film, etc., the reel →reel shaft →arm → base are electrically conduited in this machine by applying conductive paints to the inner side of take-up and rewind arms. Hence, confirm the conduity between reel shaft and base frame when replacing the arm (below 100 M Ω).

Fig.20

Ⅱ-2-3 Film Take-up and Rewinding Section

Shaft reverse tension ⑥, Magnet clutch ㉚, First sprocket ⑫, Worm gear (1) assy ㉙

Hints for Trouble-shooting

Trouble symptom	Cause
Failure in high speed rewinding	Defective ㉚ and inadequate fitting position, weak tension of ③, breakage of ④, ⑧, ㉒ and ㉙.
Excessively large wow flutter	Abrasion of ⑪, ⑭, ⑳ and ㉙, defective fixing position of ㉔
Film scratch	Scratch and deformation of ⑫ and ⑭
Auto loop setter fails to function	Adrasion of rubber pulley unit ㉙ and adhesion of oil
Excessively large noise	Abrasion and breakage of gears

Disassembly

1. Remove the back cover.
2. Remove the film thread slot section. (Refer to page 32.)
3. Remove ⑦ and then ⑧ before taking out ⑤ from the terminal plate.
4. Remove the E ring ㉑ and then ⑳, before taking out ⑲.
5. Unscrew the 2 pieces of screws ⑩.
6. Unscrew the screw ⑮, and take out ⑥ from the base frame while shifting ⑯ in the direction of arrow mark . Here, carefully remove ⑰ located between ⑯ and ⑱ so as not to drop it.
7. For further disassembly refer to Fig. 19.

Reassembly

1. Make sure that the gears as well as ⑫ and ⑭ have no scratches, abrasion and deformation.
2. Replace the rubber pulley unit ㉙ if it is worn out or/and deformed, and wipe off the adhered oil.
3. Reassembly of⑥-- (a) Insert ㉗ into ㉓, and carry out reassembly, with this E ring as the base (standard).
   (b) See Fig. 19 to close fit ㉖ into ㉗.
   (c) Inesrt ㉕ and ㉘, and then fix ㉛ and ㉙ at a position leaving no back-lash and ensuring light rotation.
4. Carry out further reassembly in the reverse order of disassembly; when tightening the 2 pieces of screws ⑩, remove the film feeding assy parts (see page 4-2) and fix where ⑥ has the lightest rotation.
5. Measure the high speed rewinding tension.
   Measuting method: Draw the spring balancer (P048) in the direction of arrow mark referring to Fig. 20.
   Adjusting method: Adjust the tension of ③ by means of the tighthess of ②, and fix ② with ① after the tension reaches the permissible range.
   Permissible range: 800 ～1000g

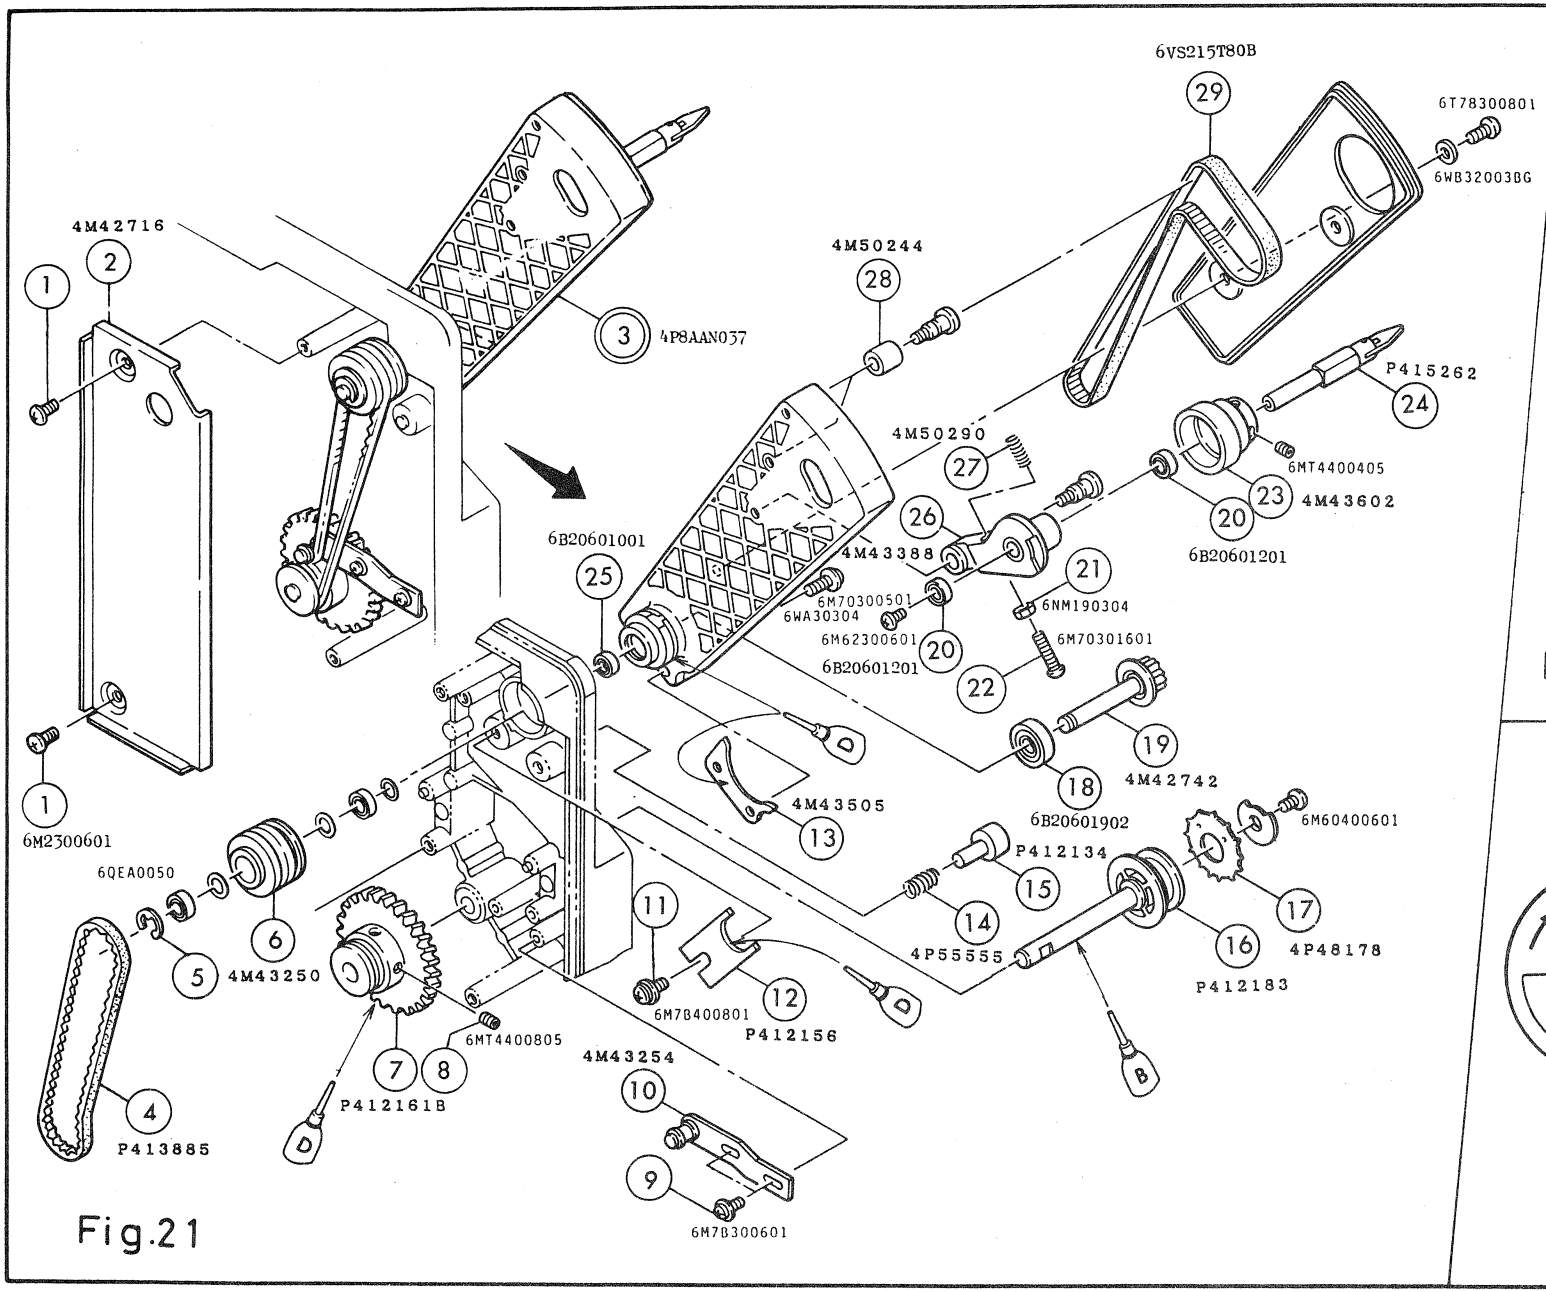

Fig.21

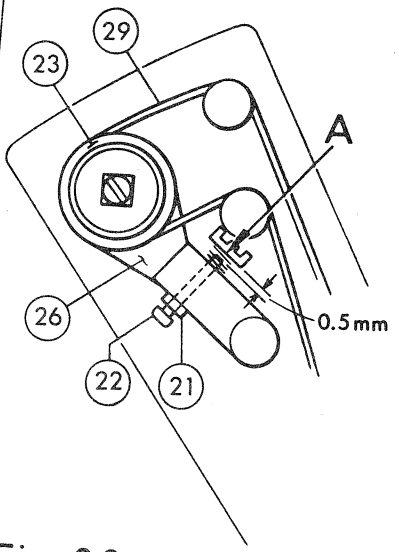

Fig.22

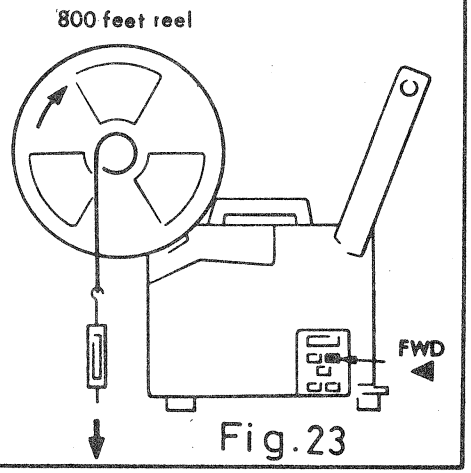

Fig.23

Ⅱ－2 Disassembly and Reassembly

Ⅱ-2-3 Film Take-up and Rewinding Section

Take-up arm assy ③, Second sprodet ⑯, Worm gear (2) assy ⑦

Hints for Trouble-shooting

Trouble symptom	Cause
Failure in take-up	Weak tension of ㉗
Take-up arm can not be fixed	Abrasion of ⑬ and ⑮
Abnormal noise at high speed rewinding	inadequate fitting position of the screw㉒
Excessively large wow flutter	Deterioration of ④, and scratch and defomation of ⑦, ⑯ and ⑰.
Film scratch	Scratch and deformation of ⑯ and ⑰

Disassembly

1. Remove the back cover.
2. Unscrew the 2 pieces of screws ① and remove ②.
3. Loosen the 2 pieces of screws ⑨, shift ⑩ sidewise, and disengage the belt ④.
4. Remove the E ring ⑤, and take out ⑥.
5. Unscrew the screw ⑪, and remove ⑫ to take out ③, taking care so as not to drop ⑭ and ⑮.
6. Loosen the 2 pieces of screws ⑧, and remove ⑦ to take out ⑯.
7. For further disassembly refer to Fig. 21.

Reassembly

1. Install ㉔, ㉓ and ㉖ after confirming that the pulley ㉓ face has no scratch, and make sure that the rotation is even and light. In case the rotation is heavy or/and uneven, replace the bearing ⑳. Similarly check and replace, if necessary, the bearings ⑱ and ㉕ if ⑲ has abnormal rotation.
2. Wipe off the oil adhered to the belt ④, and replace the belt if scratched.
3. Make sure that there are no scratches, abrasion and deformation in ⑦, ⑯ and ⑰.
4. Cotrol the movement of ㉗ so that the inner surfaces of the belt ㉙ may not come in contact with each other at high speed rewinding. Tighten ㉒ and fix with the nut ㉑ leaving a clearance of 0.5mm between [A] section and end of screw ㉒ as shown in Fig. ㉒, with the belt ㉙ in engaged state.
5. Measure the take-up tension.
   Measuring method: Draw the bar spring balancer (C067) in the direction of arrow mark, referring to Fig. 23.
   Permissible range: 100 ～150g

Fig.24

Fig.25

Ⅱ-2-4 Intermittent Film Feeding Section
Claw section frame assy ⑦, Worm (2) ⑯

Hints for Trouble-shooting.

Trouble symptom	Cause
Unstable projection speed	Inadequate fitting position of ⑦, deterioration of ⑩ and adhesion of oil
Excessively large wow flutter	Scratch and abrasion of ⑯, inadequate fitting position of ⑦

Disassembly

1. Remove the back cover, and then the 12 MF condenser (polyest film 12 MF/220 V) installed at the top of the motor.
2. Unscrew the 2 pieces of screws ⑨, and remeove ⑧.
3. Remove ⑤ by unscrewing the screw ⑥, taking care so as not to drop ④.
4. Remove ⑫ at a section by loosening the 2 pieces of screws ⑪.
5. Unscrew the 2 pieces of screws ③.
6. Take out ⑦ by lifting up the lever second sprocket ⑳ in Fig. 25 to the projecting position. The claw section frame assy ⑦ can now be removed.
7. Remove ⑬ and ⑲ by unscrewing ⑭ and ⑱ in order to remove worm (2) ⑯.
   Note: When unscrewing ⑭, slightly shift the fitting position of the relay installed on the power transformer.

Reassembly

1. Carry out reassembly in the reverse order of disassembly.
2. Engage the belt ⑩, and then install ⑦, providing back-lash in ① and ②.
3. Insert ④ after installing ⑤ to the base.
4. Fit ⑫ into the joint of ⑦, and tighten ⑪ while pressing ⑰ in the direction of arrow mark.
5. Install ⑯ pressing it in the direction of arrow mark so as to leave back-lash between ⑮ and ⑯.

Ⅱ-2-4 Intermittent Film Feeding Section

Disassembly and Adjustment of Claw Section Frame Assy Hints for Trouble-shooting

Trouble symptom	Cause
Screen turbulence (bouncing)	Inadequate fitting position of ①, abrasion of ⑦, ⑧, ⑳, ㉑ and bearing metal ②
Screen turbulence (back feed)	Excessively long lead allowance of claw ⑳, abrasion of ⑥
Film shifting	Excessively short lead allowance of claw ⑳, abrasion of bearing ⑳
Screen running (tailing of image)	Inadequate fitting position of ㊲
Unstable projection speed	Inadequate fitting position of ①, inadequate fitting position of ㉕
Excessively large noise at film feeding	Scratch in ① and inadequate fitting position of ①, abrasion of ⑦ and ⑧, scratches in ④ and ⑤, run out of grease and oil at each part, abrasion of ⑯ and ㉝.
STILL-RUN change-over cannot be made or is not smooth	Scratches and deformation of ㉘ and ㉙, malfunction of ⑪
Film gets burned at STILL projection	Breakage and malfunction of ⑬

Disassembly

1. Loosen the 2 pieces of screws ⑰, remove ㉛, and successively take (pull) out ㉚, ㉙, ㉘ and ㉗.
2. Remove ⑩ by unscrewing the 4 pieces of screws ㉔, 3 pieces of ㉖ and the screw ㉔.
3. For further disassembly refer to Fig. ㉖.

Reassembly: Confirm the following point 1 ～5 before carrying out reassembly.

1. Make sure that the bearing metal ② is not worn out. Replace ② if it is worn out creating back-lash in the direction of b-axis between ② and ③.
2. Make sure that the cam faces ④ and ⑤ have no scratches; replace the cam face having scratches.
3. Make sure that ⑥ is not worn out. If worn out, remove it from ⑳ and replace with a new one using quick set adhesives (ALPHA CYANDACRYLATE QUICK SET ADHESIVE)
4. Make sure that the bearings ⑱ and ⑳ are not worn out; replace if the bearing is worn out.
5. Make sure that the tooth surface of ① is not worn out or scratched; replace ① if the tooth surface is worn out or scratched.
6. Install ① so that ③ has no back-lash in the direction of a-axis and has smooth rotation.

Fig.26

4
5
a
b
3

Fig.27

7. Install ④ and ⑤ as shown in Fig. 27, taking care so that ⑤ may not face to wrong direction.
8. The back-lash, if between ⑤ and ⑧ may be attributed to worn-out ⑦ and ⑧: In such case, replace the ⑦ and ⑧.
9. Adjustment of protrudent length of claw tip: Adjust by bending C section of ⑳ so that the claw tip (lead) ⑳ has no inclination and extends out by 0.9 ～ 1.0mm from rail face of aperture plate.

Caution: It is desired that the triangle can ⑤ be soaked in silicon oil for one full day (24 hrs.) before replacing.

10. Adjustment of claw stroke
    Make sure that the stroke of ⑳ is such that it does not contact (touch) the film when the claw tip comes out of the perforation after the film is set on the aperture plate and fed by turning ① in the direction of arrow mark, and also when the claw tip is entering the next perforation. Adjust the stroke by shifting ⑤ in Fig. 27 to [b] direction if the stroke is small, and to [a] direction if the stroke is large. (The shaft hole of ⑤ is approximately 0.05mm larger than shaft aperture of ③.)
11. When installing ㉕ and ⑯, rotate ① and fix the 3 pieces of screws ㉖ where the rotation is lightest.
12. Make sure that ⑫ covers the aperture mask when lever ⑪ is pressed down, and that ⑪ and ⑫ return to their original position due to the tension of ⑭ and ⑮ when the lever ⑪ is released.
13. Replace ㉘ if it has scratches or burrs since ㉔ slides over ㉘.
14. The 2 pieces of springs ㉞ are for buffing the precipitous load on ㉙ and ㉟ at STILL-RUN change-over or/and at the start of projection.
15. Press ㉗ with ㉛ and tighten ⑰ so that ㉗ has no back-lash in [d] direction and has light rotation.
16. Adjustment for screen running (adjustment of shutter ㊲)
    Adjust by loosening the screw ㉙ and then shifting ㉟ and ㊲, as shown in Fig. 28, so that the sutter ㊲ blocks the aperture mask (shuts off the light) while the film is being fed by the claw ⑳.

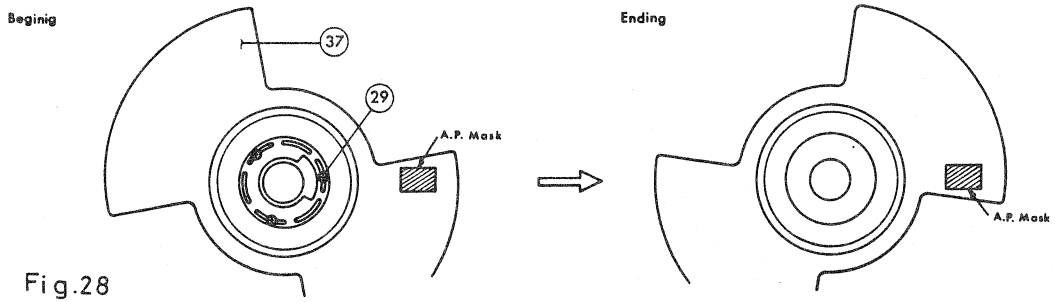

Fig.28

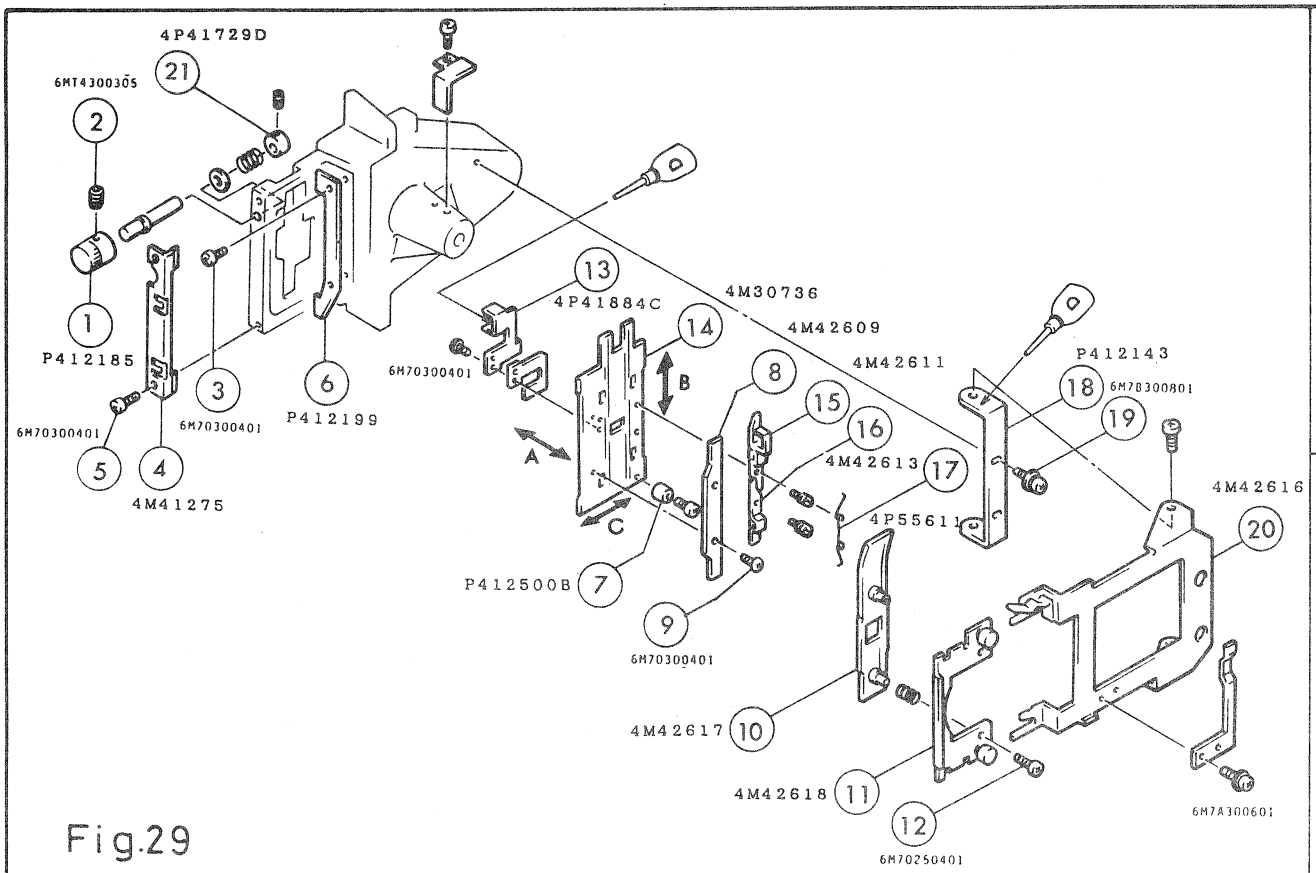

Fig.29

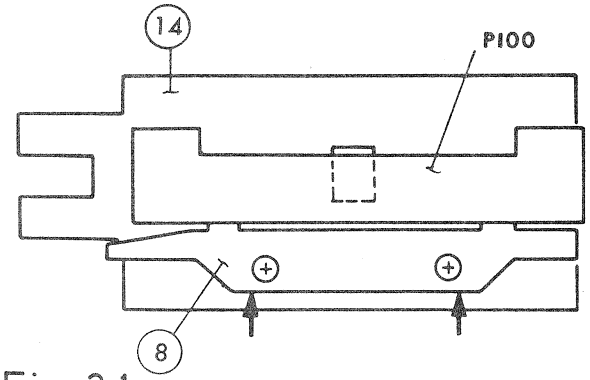

Fig.31

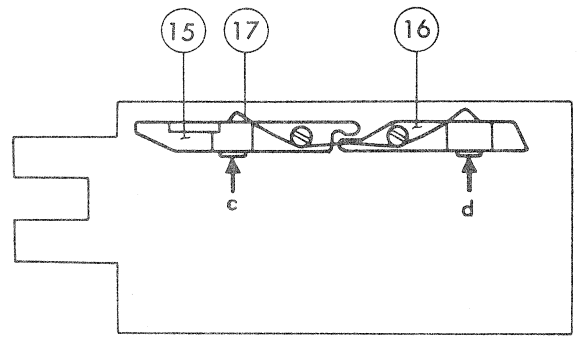

Fig.32

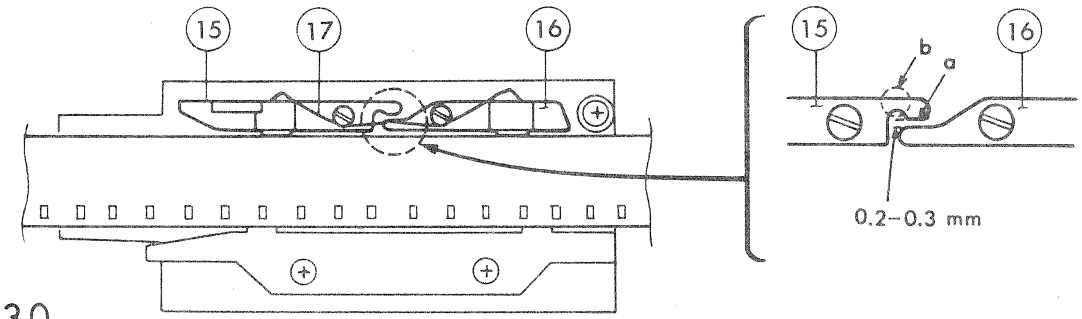

Fig.30

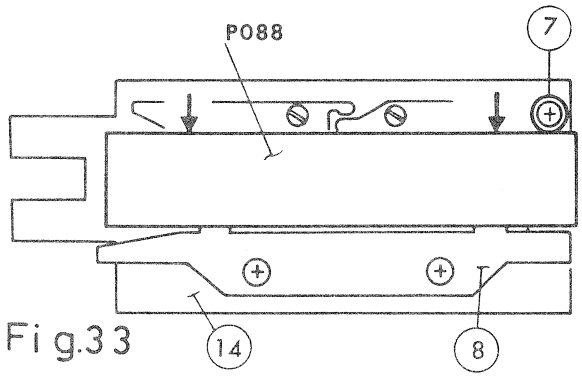

Fig.33

Ⅱ-2-4 Intermittent Film Feeding Section
Aperture plate⑭, Pressure plate⑩

Hints for Troubleshooting.

Troubly symptom	Cause
Screen turbulence (transverse turbulence)	Inadequate tension of ⑰, Inadequate fitting position of⑦ ⑧, ⑮ and ⑯
Screen trubulence (bouncing)	Abrasion of ⑧, ⑮ and ⑯, malfunction of ⑩
Film gets caught during self-loading	Inadequate fitting position of ⑳
Screen gets chipped	Inadequate fitting position of ⑧ and ⑩
Exposure	Inadequate fitting position of ⑩
Scratch of film	Scratches and abrasion of ⑩ and ⑭
Masking adjustment can not be made	Inadequate fitting position of ⑬

Disassembly

1. Carry out disassembly referring to Fig. 29.

Reassembly

1. Replace ⑭ if it has scratch or/and abrasion
2. Apply the film guide aperture installing gauge (P 100) to ⑭, as shown in Fig. 31, and press ⑧ in the direction of arrow mark to install it parallel to the rail ⑭.
3. Install ⑮, ⑯and ⑰ to ⑭, and apply the film to make sure that the clearance between ⑮ and ⑯ is 0.2 ～ 0.3mm as shown in Fig. 30. Grind off a section of ⑮ if the clearance is small, and bend by applying heat to [b] section ⑮ if the clearance is large.
4. Measure the tension of ⑰.
   Measuring method: Measure the tension at [c] and [d] points by using a dial tension gauge (063) as shown in Fig. 32. When measuring the tension at [c] point, keep ⑯ pressed in [d] direction in order to avoid the interference from ⑯.
   Permissible range: 45～55g
   Adjusting method: Carry out adjustment by bending ⑰.
5. Apply fixed guide installing gauge (P088) to ⑭, as shown in Fig. 33, and lightly press in the direction of arrow mark to fit ⑦ closely to the gauge.

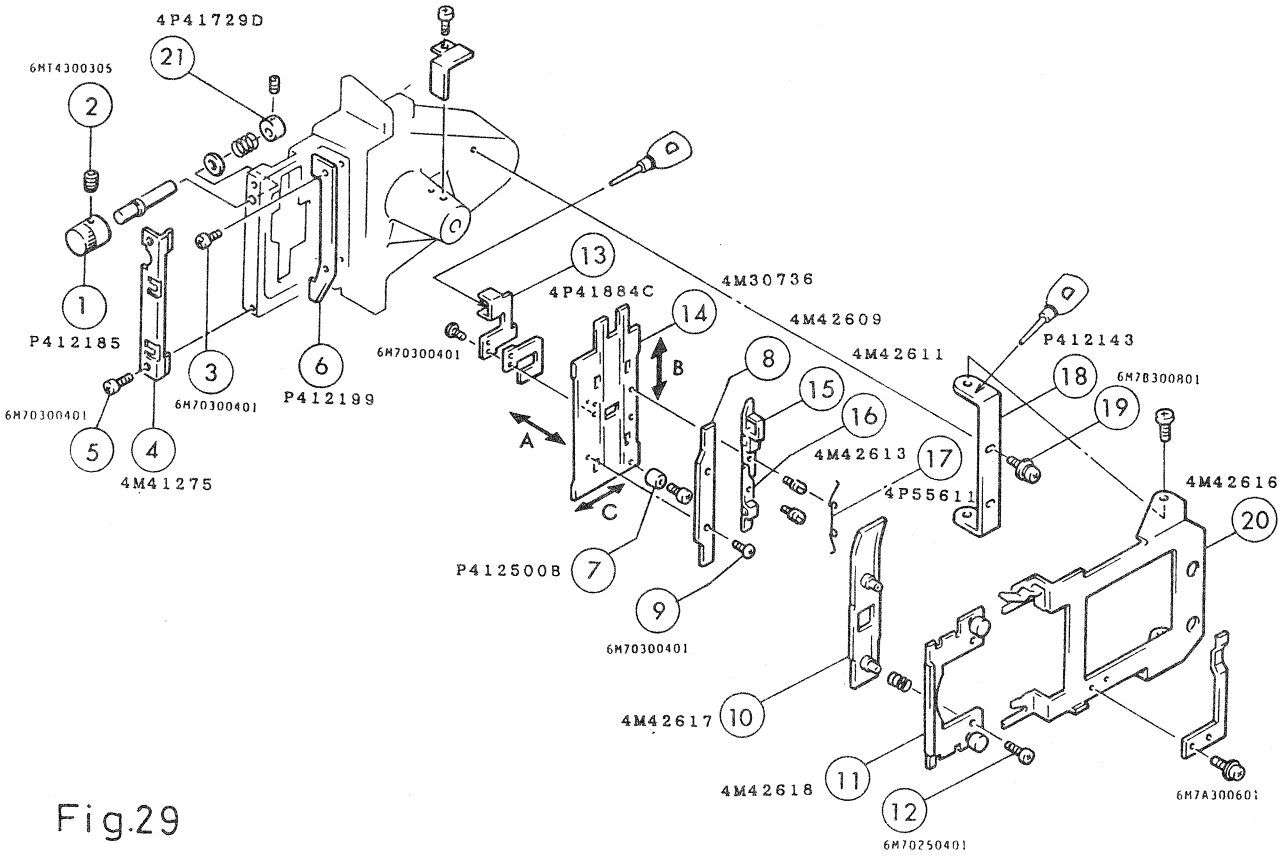

Fig.29

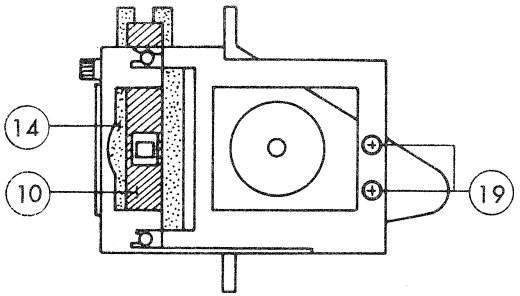

Fig.35

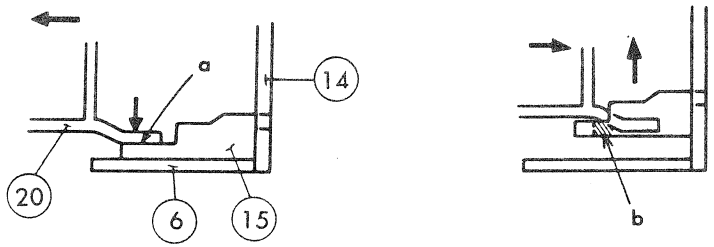

Fig.34

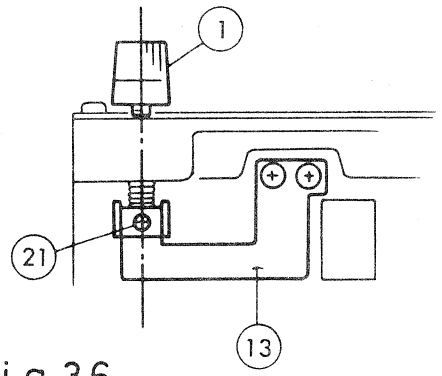

Fig.36

Ⅱ-2-4 Intermittent Film Feeding Section
Aperture plate ⑭, Pressure plate ⑩

6. Install ⑭ to the frame by means of ④ and ⑥, seeing to it that ⑭ has no back-lash in the arrow mark [A] and [C] directions in Fig. 14 and that it moves smoothly in the arrow mark [B] direction on turning the knob ①.
7. Adjust by beans of 2 pieces of screws ⑲ so that the masks ⑩ and ⑭ are set in the positions shown in Fig. 35, and after installing them to the main body, set the machine to PROJECTION to confirm that the screen has no chipping or/and exposure.
8. Since the film at self-loading is fed by first sprocket and accordingly, the feeding claw of film feeding section is not used, see to it that ⑩ and ⑭ in Fig. 29 are not closely contacted and that ⑮ and ⑯ are also open. Here,adjust the opening as well as the timing of opening of ⑮ and ⑯. Make adjustment by bending a section so that ⑮ gets pressed by ⑥ just before the a section of ⑳ comes off ⑮ when ⑳ is opened, and when ⑳ ia closed there is a gap in [b] section to keep ⑳ and ⑮ apart as shown in Fig. 34.
9. Masking adjustment: Adjustment is made by correcting the deflection between film perforation and screen or by correcting the gap difference between forward/reverse feeding claw and perforation, and the correction is made in two ways: feeding claw moving system and aperture plate moving system. In this machine, however, the aperture moving system is adopted for correction.
   a) Install ① to an appropriate position so that the stopper of the knob ① and the fitting screw ㉑ are coaxially located as shown in Fig. 36.
   b) Make sure that there is no back-lash in slots (grooves) ⑬ and ㉑ in Fig. 36. In case there is back-lash, correct by bending the slot.
   c) Next install to the main body, project the film (P086), and adjust the upper and lower masking.
   d) Adjust by shifting the position of ⑬ in Fig. 36 so that the second line of the target outermost circle of the next coma is visible when the masking at forward projection is set all the way down to the lower side.

Ⅱ-2-5 Motor Section
Motor (1) assy ⑨ and Fan ⑦

Hints for Trouble-shooting: Refer to Hints for Trouble-shooting" of [ELECTRIC CIRCUIT in item Ⅲ]:

Trouble symptom	Cause
Motor fails to operate.	Defective ③ and ④, inadequate contact of ⑤
Unstable projection speed	Inadequate cleaning of ⑥ and ⑧
Abnormal noise	Deterioration of ② and breakage of ⑦

Disassembly

1. Remove the back cover.
2. Pull out ⑤ from transformer terminal plate.
3. Remove ⑫ by unscrewing 3 pieces of screws ⑩ and ⑪ x 2.
4. Remove ⑨ by unscrewing 4 pieces of screws ①.
5. For further disassembly, refer to Fig. 38.

Reassembly

1. Thoroughly wipe off the dusts such as oil, etc. from ⑥ and ⑧, and replace if ⑧ has cracks, etc.
2. Make sure that ② is not deteriorated.
3. Make sure that the fan ⑦ is not broken. (Replace the fan if even a single blade is missing or is broken.)
4. Temporarily tighten ⑥ and ⑦, engage ⑧, and install ⑨ to the base.
5. Rotate ⑦, and fix after making sure that it does not tiych the base.
6. Fix ⑥, making sure that there is no torsion (twist) in ⑧ and that ⑧ is at straight lines with shutter pulley.
7. Install ⑫, and insert ⑤.

Ⅱ－2 Disassembly and Reassembly

Ⅱ-2-6 Transformer and Amplifier Section
Transformer assy ⑳, Amplitier assy ⑰ and Control plate assy ⑬

Hints for Troubleshooting: Refer to ["ELECTRIC CIRCUIT" in item Ⅲ] for the description and trouble-shooting hints of control plate

Trouble symptom	Cause
Failure in power supply	Disconnection of ⑩
Motor fails to operate.	Defective ④, Inadequate contact or/and cord disconnection of connectors ⑥ and ⑦
Motor does not change over from normal to reverse operation or vice versa.	Defective ③
Amplifier fails to function	Inadequate contact or/and cord disconnection of ①
Lamp does not light up	Defective ②, inadequate contact or/and cord disconnection of ⑫
Failure in change-over of lamp L-H	Defective ⑨
Control circuit fails to function	Inadequate contact or/and cord disconnection of ⑧

Disassembly

* Removing the amplifier ⑰ and control plate
1. Remove the back cover.
2. Remove ⑱ by unscrewing 2 pieces of screws ⑯.
3. Pull out the M-O change-over knob, amplifier double knobs (1) and (2).
4. Pull out the connectors 2P, 5P and 6P from the amplifier.
5. Pull out the connectors 2P, 3P,4P,8P and 13P from the control plate.
6. Pull out the connectors 5Pand 4P from ⑪ and 2 pieces of blue and white cords from relay ② on ⑪ and ② sides respectively
7. Remove ⑰ by unscrewing 3 pieces of screws ⑮.
8. Pull out 7P connectors on ⑬ side and 2P connector on ⑰ side, and unscrew 3 pieces of screws ⑭ in order to remove ⑬ from ⑰.

* Removing the transformer ⑳
1. Remove the back cover, and then ⑱ by unscrwing 2 pieces of screws ⑯.
2. Pull out ⑥, ⑦, ⑧ and ⑫.
3. Remove ⑳ by unscrewing 4 pieces of screws ⑪.

Reassenmbly
1. Carry out reassembly in the reverse order of disassembly, making sure the connectors have no defective contact and that the cords have no scratch or/and disconnection.
2. After installing ⑰, make sure that the cords do not touch the flywheel ⑲ and that the M-O change-over activates accurately.

Fig.40

Fig.41

Ⅱ－2 Disassembly and Reassembly

Ⅱ-2-7 Link Section

Lever middle tension ㉓, Lever guide roller (4) ⑨ and Lever (2) second sprocket ⑱

Hints for Trouble-shooting·

Toruble symptom	Cause
Film scratch (on film surface)	Uneven rotation of rollers
Film scratch (on perforation)	Improper tension of ⑮
Excessively large wow flutter	Uneven rotation and abrasion of ㉒, misadjustment of tension of ㉗

Disassembly

1. Remove the front cover.
2. Remove ①～⑦ referring to Fig. 40.
3. Remove ㉓ by unscrewing the screw ㉕ and the E ring ㉔.
4. Unscrew the screw ⑯.
5. Pull out ⑨ after removing ⑫～⑭.
6. Take care since ⑩ is screwed at the back of the base (rear of worm gear (2) assy).
7. Take out the spring ㉑ on [A] side in order to remove ⑲, ⑳ and ⑱ simultaneously.
8. For further disassembly, refer to Fig. 40.

Reassembly

1. Make sure that the rollers and shaft have no scratch, burrs etc. and that the rollers have even and smooth rotation.
2. For further reassembly, refer to Fig. 40.
3. Measure the tension of ⑮ by using the bar spring balancer (P048) as shown in Fig. 41. The permissible tension range is 500～600g ; replace the spring having tension higher or lower than this value.
4. Adjust the tension of ㉗ so that the lever ㉓, on feeding the film, stands almost at the center from [A] and [B] points as shown in Fig. 41. (Check optical as well as magnetic reproduction.)

Ⅱ-2-7 Link Section

Link (1) ⑯, Reverse lever ⑮, Lever guide roller (3) ⑱ and Lever pressure roller ②

Hints for Trouble-shooting.

Trouble symptom	Cause
Motor fails to operate	Defective ⑩
Failure in reverse porjection	Inadequate contact of ⑤ and cord disconnection, defective ⑪
The machines does not set to self-loading state	Malfunction of ⑯, weak tension of ⑬ and ⑳
Excessively large wow flutter	Scratch and uneven rotation of ①, improper tension of ③
Film scratch	Scratch and uneven rotation of ① and ⑧

Disassembly

1. Remove the front cover and the operation cover.
2. Remove ①～⑤ in Fig. 40 on page 55.
3. Remove ㉑ by unscrewing 3 pieces of screws ㉒.
4. Remove the spring ⑬.
5. Remove the assy of ⑮ by taking out ⑥ and ⑭, taking care so as not to cut the cord of connector ⑤ connected to the control plate.
6. Pull out ② by taking out ③ on [A] side.
7. Remove ⑯ by unscrewing the screw ⑲ in Fig. 40 on page 55.
8. Take out ⑨ on [B] side, and then ⑰ before removing ⑱.
9. For further disassembly, refer to Fig. 42.

Ⅱ－2 Disassembly and Reassembly

Reassembly

1. Refer to "Driving Mechanism Functions in Ⅱ-1" for the functions of links and levers.
2. Wipe off the dust from ① and ⑧, and replace if scratched, then install and make sure that they have smooth rotation.
3. Reassemble ② and ④ in Fig. 43 so that the oblique-line sections fall on the same surface (i.e. the oblique-line sections are cofacial).
4. Install ⑱ and make sure that it moves lightly. Apply the tension ⑨, making sure that ⑱ touches the stopper 27 in Fig. 43. Measure the tension of ⑨ at arrow mark [A] position in Fig. 43 by using a dial tension gauge (C063). Replace ⑨ if the tension is higher or lower than the permissible tension range of 20～30g.
5. Install ⑲ by hooking it to ⑱. (See the dotted-line diagram in Fig. 43.)
6. Install ⑯ to the base by means of ㉖, and adjust the fitting position of ⑩ so that the switch ⑩ is pressed by ⑯ when ㉕ is pressed as shown by the arrow mark (forward projection state).
7. After installing all parts to the base, set to forward projection to measure the tension of ③ at the arrow mark [B] position in Fig. 43 by using a bar spring balancer (C067). Replace ③ if the tension is higher or lower than the permissible tension range of 200 ～ 300g. Furthermore, make sure that all links have normal functions repeating the forward projection-stop-reverse projection operations.

Ⅱ－2 Disassembly and Reassembly

Ⅱ-2-8 Loop Restorer Section: Refer to "Automatic Loop Restorer Mechanism in Ⅱ-1-7."
Friction wheel (2) loop restorer ⑨ and Link (2) loop restorer ⑯

Hints for Trouble-shooting

Trouble symptom	Cause
Loop restorer fails to function	Misadjustment of ③
	excessively strong (high) tension of ⑮ (see page 60)
	adhesion of oil onto ⑨
	uneven rotation of ⑨ due to defective ⑩
	inadequate fitting position of ②
Loop restorer continues functioning	Misadjustment of ③

Disassembly

1. Remove the back cover.
2. Remove the claw section frame assy. (Refer to page 42.)
3. Remove ⑯ by unscrewing ⑲, ⑰ and ⑳ successively. (Unscrew ⑳ carefully so as not to drop ⑫.)
4. Pull out ⑨ by unscrewing ⑪.
5. Remove ③ by loosening ④.
6. Remove ⑥ and ⑦ by unscrewing 2 pieces of screws ⑤.
7. For further disassembly, refer to Fig. 44.

Reassembly

1. Wipe off oil from ⑨ before installing with ⑪, making sure that ⑨ has smooth rotation. If the rotation is not smooth, it may be attributed to defect in ⑩.
2. Carry out further reassembly in the reverse order of disassembly.
3. Adjust the timing for loop restorer start.
   a) Feed the film, and stop temporarily by depressing the PAUSE switch, make the lower loop one coma shorter and restart.
   b) Repeat this operation till the lower loop gets gradually smaller until it begins to touch the roller ⑬ installed to ⑭. Then fix ③ with ④ so that, just before the roller ⑬ starts to rotate, the film touches the bottom of ⑦, pushing up ⑧ and unlocking ⑨ to set the loop restorer to function. In case the loop restorer fails to function even when the film touches ⑬ generating vibration sound, carry out film alignment by loosening ① and rotating ② slowly.

Ⅱ－2 Disassembly and Reassembly

Ⅱ-2-9 Flywheel Section

Shaft flywheel assy ③, Flywheel ⑰, Lever pad roller ⑨ and Lever assy photo diode ⑧

Hints for Trouble-shooting.

Trouble symptom	Cause
Excessevely large wow flutter	Uneven rotation of ③, ⑤ and ⑮, eccentric ⑰.
Optical reproducing sound does not come out.	Disconnection of ⑲
Insufficient optical reproducing sound	Malfunction of ⑧, dust in ⑳
Insufficient magnetic reproducing sound	Uneven rotation of 23, improper tension of㉔
Improper S/N ratio	Inadequate fitting positions of ② and ㉑

Disassembly

1. Remove the back cover and the amplifier assy.
2. Pull out ⑰ by taking out ⑱.
3. Remove ④ by unscrewing ⑪, and then pull out ③.
4. Remove ⑫ by unscrewing 2 pieces of screws ⑬.
5. Remove ⑧ and ⑨ by unscrewing ⑥.
6. For fnther disassembly, refer fo Fig. 45.

Reassembly

1. Make sure that ③ has no scratch and that the two pieces of bearings ⑤ have no abnormality in rotation. Then tighten ⑯ so that ③ has no back-lash in the direction of arrow mark A and has smooth rotation.
2. ⑮ not only holds the film feeding position but also works as the impedance roller, and accordingly improper setting of its fitting position may resuly in unstable traveling of the film and may directly cause deterioration in properties such as wow flutter, etc. Hence, make a thorough check to see that there is no scratch or/and deterioration of rubber face, and then tighten ⑭ so that ⑮ has no back-lash in the direction of arrow mark B and has smooth rotation.
3. Install ㉓ carefully so that there is no scratch or/and deterioration of rubber face and the rotation is smooth.
4. Refer to "Measuremet of S/N Ratio" on page 69 for deciding the position of ㉒. Slightly move (rotate) ㉒, and fix with (21) where S/N ratio is largest. Similarly, after soldering ② to ①, search for the position where S/N ratio is largest by slighty moving (rotating) ②.
5. Measure the tension of ㉔ at the arrow mark C position by using a dial tension gauge (C062), with the machine set for magnetic reproduction projection. Replace ㉔ if the tension is higher or lower than the permissible tension range of 20～25g
6. Make sure that ⑳ has no dust such as oil, etc.

Ⅱ－2 Disassembly and Reassenbly

Ⅱ-2-9 Flywheel Section
Sound lens assy ③ and Lever head assy ⑬

Hints for Trouble-shooting·

Trouble symptom	Cause
Optical reproducing sound does not come out	Disconnection of ④
Insufficient optical reproducing sound.	Inadequate fitting positions of ③ and ⑦
Exciter lamp does not light up	Inadequate contact of ⑩ and ⑪
Magnetic reproducing sound does not come out	Disconnection of ⑳
Insufficient magnetic reproducing sound.	Inadequate fitting positions of ⑦ and ⑳, improper tension of ㉒

Disassembly

* DO NOT remove ② from ⑦ since it is installed with special gauge.

1. Remove the front cover.
2. Remove the link (1) and the reverse lever. (Refer to page 58.)
3. Remove the lever pad roller. (Refer to page 64.)
4. Pull out ⑬ by unscrewing ⑫.
5. Loosen ⑤, unscrew ⑥ and take out ⑦.
6. For further dissassembly, refer to Fig. 47.

Reassembly

* Magnet Head

1. Carry out reassembly in the reverse order of desassembly.
2. Adjust by means of the screw ㉓ so that the lead allowance of ⑳ extends out approximately 0.2mm on the pad roller assy ㉔ side from the virtual film feeding line connecting flywheel assy ㉕ to 9. (See Fig. 46.)
3. Make adjustment so that the center (gap) of ⑳ comes on the center line W of ㉔. (See Fig. 46.)
4. Adjust by means of 3 pieces of screws ⑰ so that the gap x between ⑳ and ⑲ is approximately 2.5mm. (See Fig. 46.)
5. Measure the tension of ㉒ at the position shown in Fig. 46 by using a bar spring balancer (C043). Adjust by bending ㉒ if the tension is higher or lower than the permissible tension range of 60～100g
6. After the adjustments in 2～5 are made, make the magnetic azimuth alignment film (P040) move at VR position allowing no distortion in output wave, and search for the position allowing mo distortion in output is maximum by slightly turning (fi (fine adjustment) the 3 pieces of screws ⑰, before fixing with screw lock.
   Max. output: Over 14 V

Ⅱ－2 Disassembly and Reassembly

Sound Lens Assy

1. Make sure that lens surface ③ is not stained with oil, dust, etc. Replace if the inner lens of ③ is clouded (obscured) or/ and stained.
2. Extend ③ by approximately 9mm from ②, and temporarily tighten with ①. (See Fig. 48.)
3. Make the sound focus film (P035) move at VR position allowing no distortion in output wave, then search for the position where reproduction output is maximum by slightly moving ③ up and down and left and right, before tightening ①.
   Max. output: Over 14 V
4. Make buzz track adjustment before the previous item 3 if (7) is disassembled from the base.
   Shift ⑦ back and forth (arrow mark direction) with the nut ⑥ while making the optical buzz track film (P032) move at max. VR of the amplifier, and find the position where both low sound zone 300 Hz and high sound zone 1 kHz of the film can not be heard, before fixing with the screw ⑤. The optical buzz track film (P032) is recorded as shown in Fig. 49.

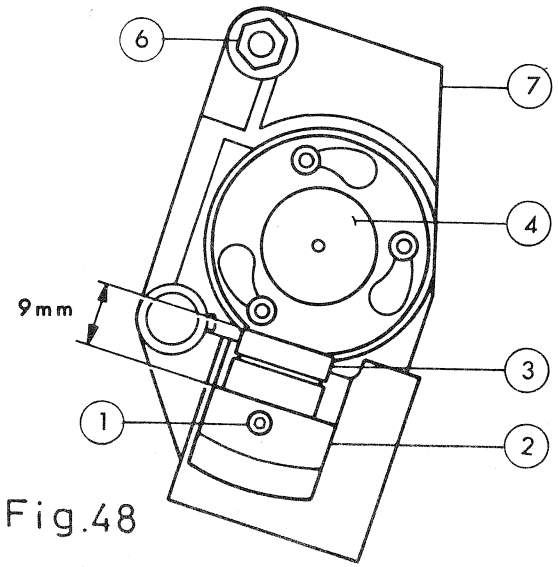

Fig.48

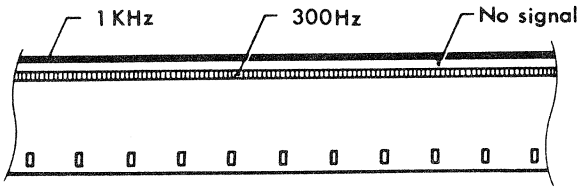

Fig.49

Ⅱ－2 Disassembly and Reassembly

Ⅱ-2-9 Flywheel Section

Measurement of Sound Performance

1. Distortion factor (both optical and magnetic): Less Than 5%
   Applicable film: Optical 400Hz signal level film (P033)
   Magnetic 400Hz signal level film (P037)
   Measuring apparatus: Distortion (factor) meter (P0849)
   Measuring method: Project the P033 (P037) film, with the tone control knob at center posotion, and turn the VR knob until the rated output (25 W-14V) is obtained. Then read the distortion factor range from the distortion meter.

2. S/N ratio (both optical and magnetic): More Than 40 dB when lamp is lit up
   Applicable film: Optical 400Hz signal lever film (P033)
   Magnetic 400Hz signal level film (P037)
   Measuring apparatus: Distortion meter
   Measuring method: Project the P033 (P037) film, with the tone control knob at center position, and trun the VR knob until the rated output (25W-14V) -2 dB is obtained, then stop projection and remove the fiim. Read the level range of distortion meter when sitting for reprojection.

3. Measurement of flutter (both optical and magnetic): Less Than 0.5%
   Applicable film: Optical flutter film (P034) and magnetic flutter film (P038)
   Measuring apparatus: Wow flutter meter (P083)
   Measuting method: Project the P034 (P038) film, and read the JIS WEIGHTED range of wow flutter meter.

4. Measurement of frequency response

Applicable film: Optical multi-frequency film (P036) and magnetic multi-frequency film (P039)

Measuring apparatus: Distortion meter

Measuring method: Project the P036 (P039) film, and set by means of VR knob so that the level range of distortion meter at 400Hz signal is 4 V (12 dB), and read further signals at this position to make sure that they fall within the range of Fig. 50.

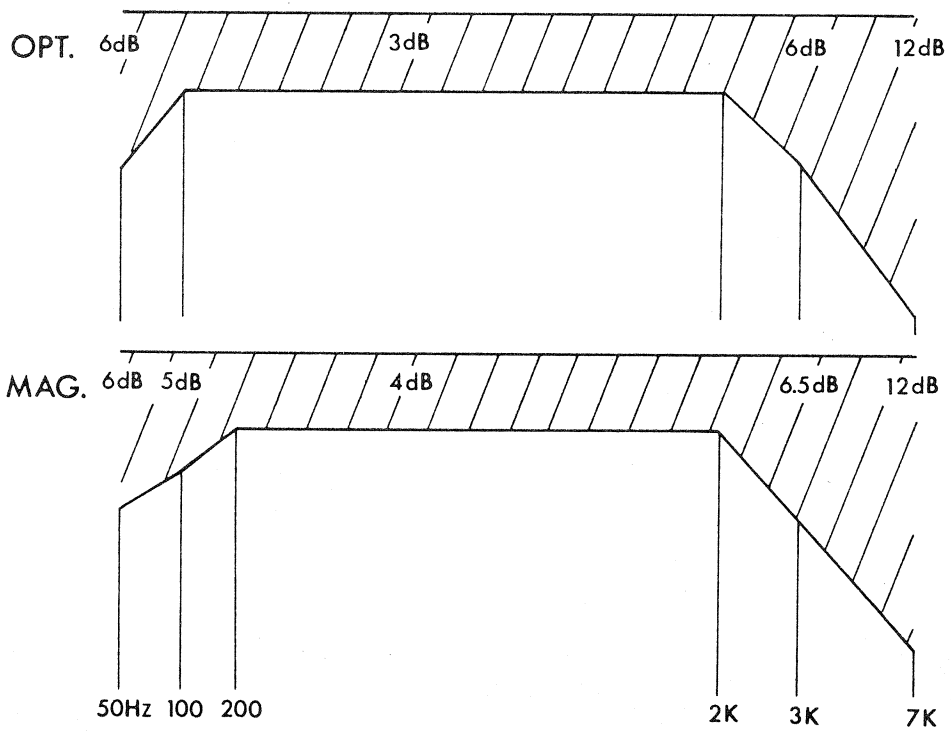

Fig.50

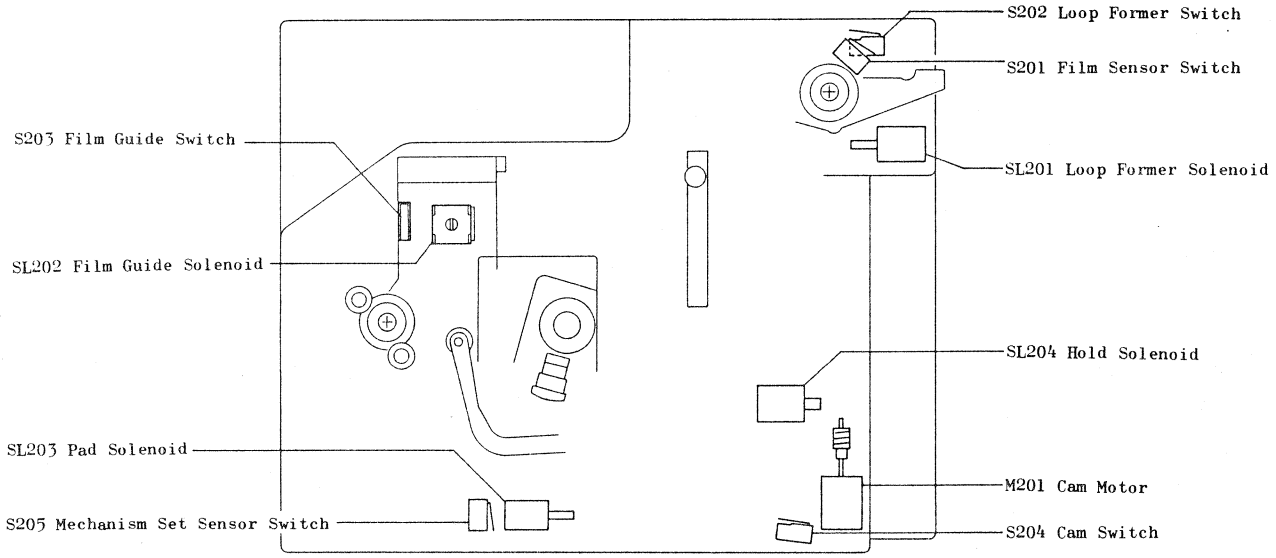
Ⅲ－1 Outline of Electric Circuit

Ⅲ-1-1 Electrical Specifications

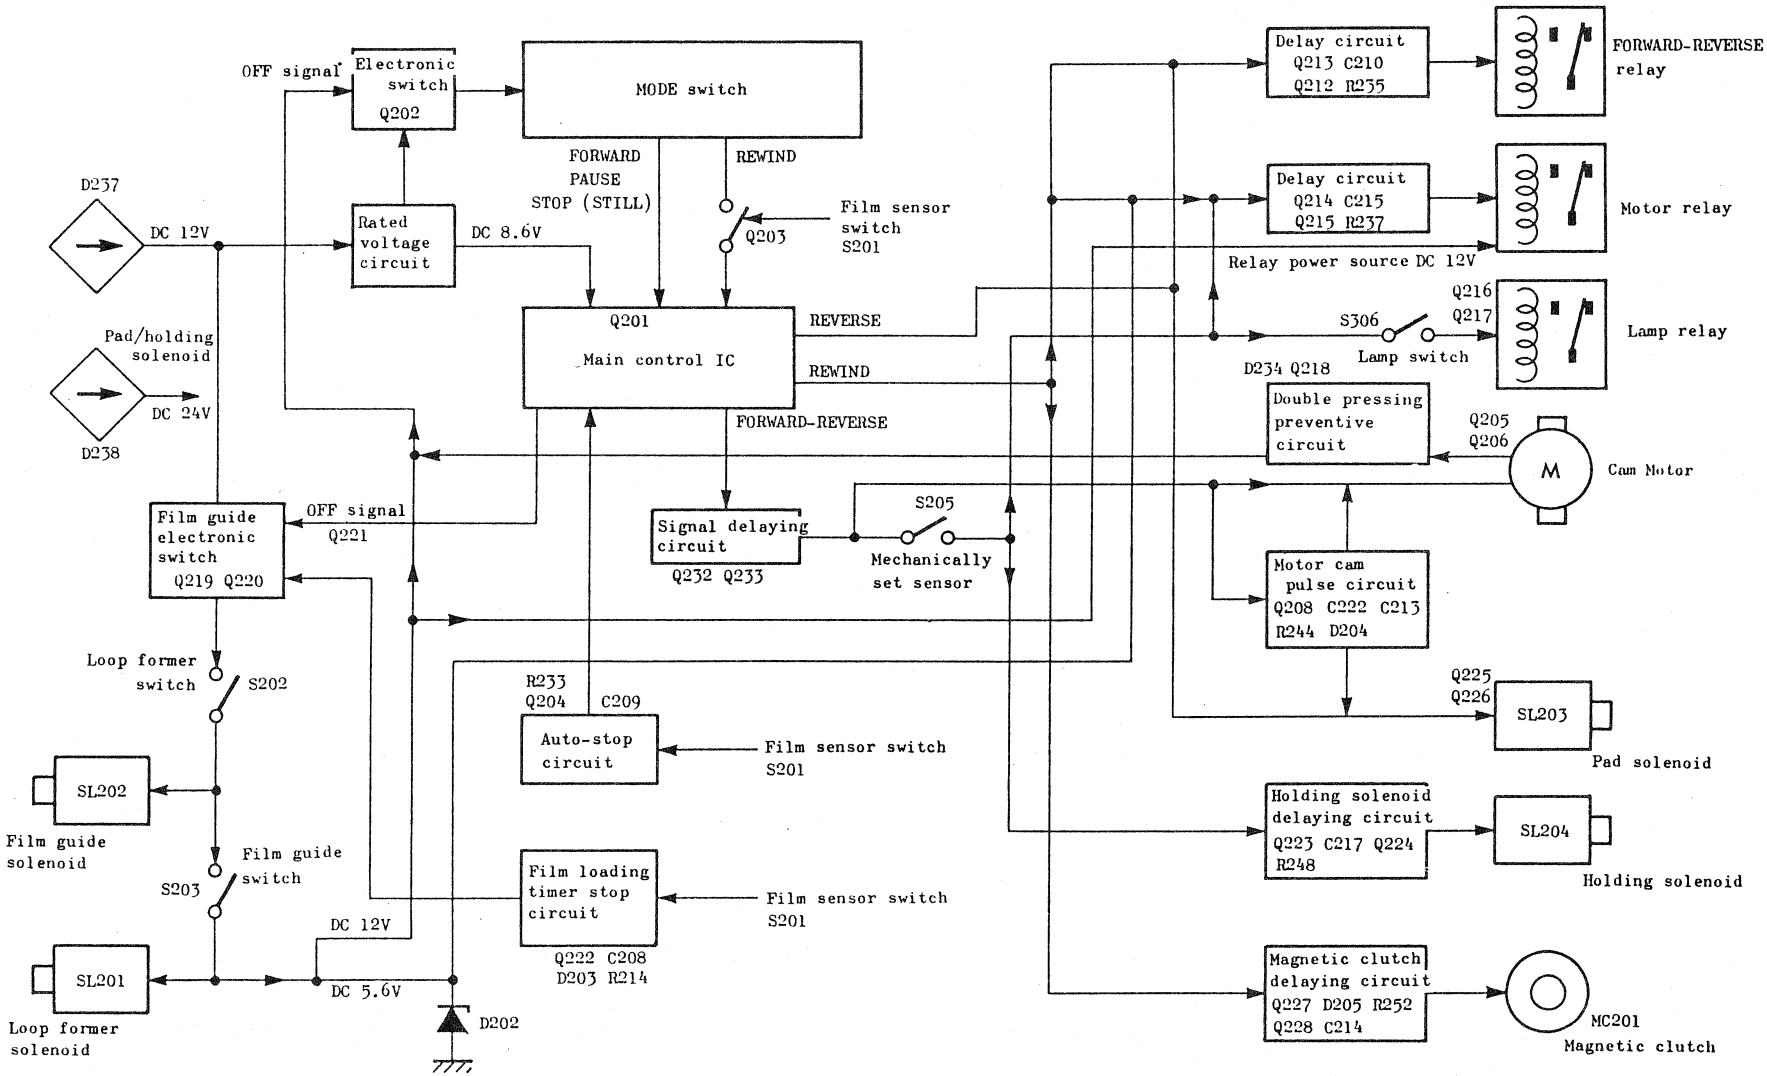
1. Adoption of push-button switch by logical control
2. Adoption of safety mechanism that stops projector when film is taken up on completion of projection
3. Adoption of timer stop mechanism that releases the self loading mechanism in a specified time interval after film is inserted into the film slot
4. Adoption of remote control mechanism that enables all functions other than rewinding
5. Adoption of pause mechanism that enables quick start or/and stop
6. Adoption of mute circuit interlocked with exciter lamp in amplifier circuit
7. Adoption of 30 W amplifier with external speaker safety circuit

Ⅲ－2 Control Circuit

Ⅲ-2-1 Block Diagram and Layout Drawing for External Parts



III-2 Control Circuit



Ⅲ－2 Control Circuit

See Connection Diagram E 21349 and Layout Drawing for description of control circuti.

The main controller of the control circuit for this machine is Q201 (TC9143P), which is an IC for logic control.

Ⅲ-2-2 Signal Transfer for Forward Projection

1. Depress the FWD switch (S302).

2. Pin ④ of Q201 turns to "H" (high), and FWD signal (pin ⑬ "H") is transmitted from pin ⑬.

3. The "H" signal from pin ⑬ passes through D217 and Q232, and turns Q206 to ON. When Q206 turns to ON, the cam motor starts rotating, and the link (1) starts to move, turning the mechanical set sensor (S205) to ON near the end point of travel.and then turning the holding solenoid (SL204) and motor relay (RY101) successively to ON. The delay in turning the motor relay (RY101) to ON is for rotating the motor only after setting the film to both sprockets in order to hold (keep) the loop of the film between first and second sprockets. This delay circuit is composed of Q211, Q210, D243, C216, R222 and R255. The motor relay (RY101) is approximately 0.5 seconds delayed than the holdeing solenid (SL204). (See Fig.54, "Timing Chart" on page 80.)

4. Turn the lamp to ON/OFF by manipulating the LAMP switch (S306) on operation switch plate (board). This switch (S306) is a holding type push-button switch, and when RWD is depressed, with this switch turned to ON, the lamp lights up, indicating that the machine is ready for projection.

5. When PAUSE switch (S304) is depreessed during forward projection, Q209 turns to ON whereas Q210 base gets grounded, turning Q210 to OFF, which then causes Q211 to turn to OFF and the power sources of lamp relay (RY103) and motor relay (RY101) to cut off. This causes the lamp to extinguish and the motor to stop, with the links still set for forward projection.

6. In order to stop the projector, depress the OFF switch (S301), which grounds the pin ⑥ of Q201 and sets the pin ⑬ to "L" (low), causing the lamp to extinguish and the motor to stop. The holding solenoid (SL204) gets released approximately 1 second after the motor has stopped. This delay is for securing appropriate loop length of the film between first and second sprockets. The circuit for this delay is determined by means of the time constant of C217, R248 and R249. (See Fig. 54, "Timing Chart" on page 80.)

Ⅲ-2-3 Signal Transfer for Reverse Projection

1. When REV switch (S303) is depressed, the pin ③ of Q201 gets set to "H" and the REVERSE signal ("H") transmitted from the pin ⑭ sets the pad solenoid (SL203) to function for several seconds, simultaneously setting the motor circuit to REVERSE mode by activating the motor FWD-REV relay (RY102). Other functions are similar to those at "Signal" Transfer for Forward Projection." However, the PAUSE mechanism does not function at reverse projection.

Ⅲ-2-4 Signal Transfer for Rewinding

1. On depressing the RWD switch (S305), the pin ② of Q201 is set to "H" only when there is no film in the film path, and REWIND signal ("H") transmitted from the pin ⑮ successively turns FORWARD-REVERSE relay (RY102) and motor relay (RY101) to ON, causing the magnetic clutch (MC201) to activate after several seconds. This delay (of several seconds till the magnetic clutch activates after the motor starts rotation) is used for taking up the slack of the film, with the rewind tension of reverse projection used as the initial torque for rewinding.
   (The pin ② of Q201 does not set to "H" when there is film in the film path since Q203 in this case is turned to OFF.)

2. In order to stop rewinding, depress the OFF switch (S301), which grounds the pin ⑥ of Q201 and sets the pin ⑮ to "L", releasing the magnetic clutch (MC201), motor relay (RY101) and FORWARD-REVERSE relay (RY102).
   As for the motor control relay timing, the timing is set for reversing the motor in a manner that the FORWARD-REVERSE relay (RY102) first turns to ON and then the motor relay (RY101). when motor stops, the motor relay first turns to OFF and then the FORWORD-REVERSE relay turns to OFF. This is for preventing the relay contact from getting burned. the delay circuit being composed of C201, R235, C215 and R237. (Refer to Fig. 56. "Timing Chart" on page 81 for the timing.)

Ⅲ-2-5 Signal Transfer for Self-Loading

1. On pressing down the loop former, the loop former switch (S202) turns to ON, activating the film guide solenoid (SL202) to pull the film guide.

2. When the film guide is set to the film path on base frame, the film guide switch (S203) turns to ON, activating the loop former solenoid (SL201) and locking the loop former in self-loading state. In the mean time the DC 12 V signal from the film guide switch (S203) as well as the signal reduced to 5.6V by D202 activates the motor relay (RY101). The DC 12V signal passes to the base of Q202 to turn it to OFF, which then cuts off the power supply to the MODE switch so that the MODE switch may not get activated during the time the loop former is locked (i.e. during self-loading).

3. When the loop former is locked and the motor rotates to start feeding film from the film gate, the film sensor switch (S201) turns to ON and changes C 208 so far grounded in R213 (100 Ω), finally turning Q222 to ON after elapse of the specified time.

4. When Q222 truns to ON, the base of Q220 is grounded, turning Q222 as well as Q219 to OFF. This results in the cut-off of power supply to solenoid relays, stopping the projector and releasing the loop former.

5. The loop former release time can be adjusted by means of R214. Set (the timer stop mechanism) so that the projector stops when the film lead (end) extends out by 70 ～ 100cm from the projector.
   The OFF switch (S301) can also be used for release/stop.

Ⅲ-2-6 Independent Circuits

- Film Sensor Circuit

When there is no film in the film path, the film sensor switch (S201) is at "CLOSE" position. This switch controls the following three circuits.

1. It uses Q203 as a switch by controlling the base potential of Q203, and turns the REWIND switch signal to ON or OFF.

2. It detects the loop former release time (timer stop circuit) at self-loading.

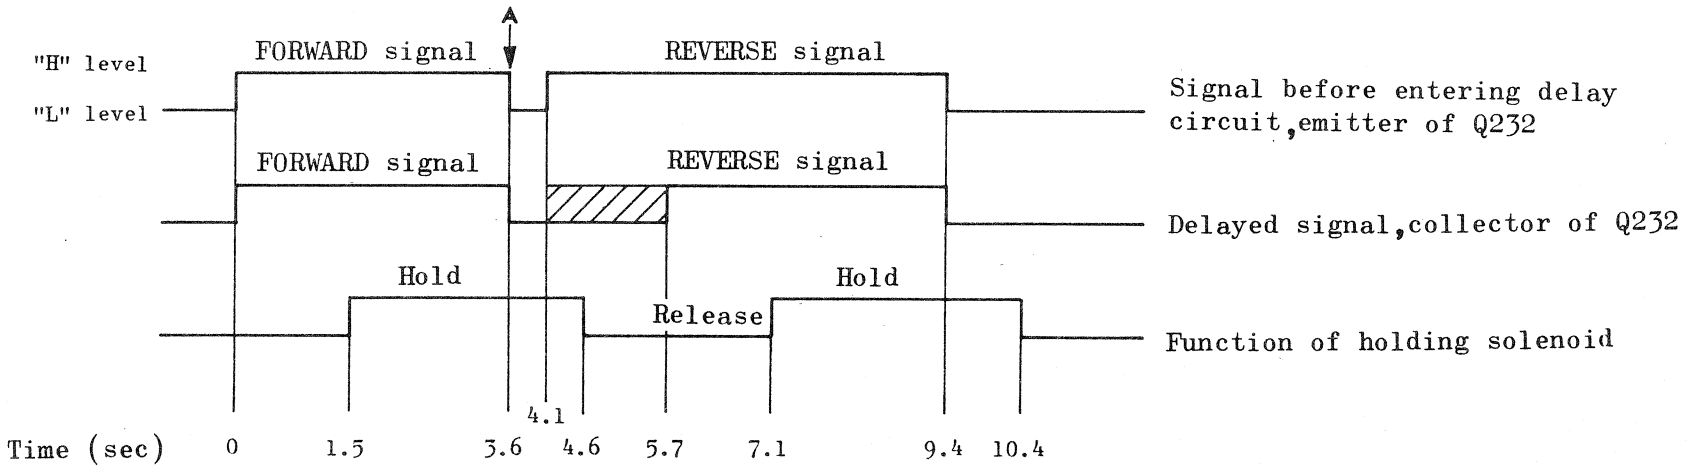
3. It turns Q204 to ON and stops the projector (automatic stop circuit) when the film, at forward/reverse projection, deverts from this sensor and is out of the film path.

* Automatic stop circuit
When projection starts, with the film set to the film path (i.e. film sensor switch "S201" in "OPEN" state), and the FOWARD (REVERSE) signal is transmitted, the signal passes through R230, R231 and D226 before getting charged in C209. When the projection completes and the path has no film in it, the film sensor switch (S201) turns to CLOSE, grounding the emitter of Q204 through D225. The charges in C209 then flow to the base of Q204 through R233, turning Q204 to ON for several seconds. The Q204 then grounds the pin ⑧ of Q201, which is the auto-stop terminal.
Accordingly when this terminal is grounded, Q201 is set to STOP mode, causing the projector to stop.

- Signal Delay Circuit for Forward-Reverse Direct Change

When the mode (FORWARD-REVERSE) is changed directly, Q201 (TC9143P) takes 0.5 second to pass through STOP mode before shifting from the preceding mode (ex. FORWARD) to the next mode (ex. REVERSE). It takes 1 second, after the mode is set to STOP, for the holding solenoid (SL204) to get released. Changing the mode directly from FORWARD to REVERSE with the circuit intact i.e. with the holding solenoid not yet released, causes the motor only to rotate reversely while the pressure roller, tension roller and brake roller remain held up in FORWARD position (keeping the film in pressed state), resulting in damage to the film. To avoid this, the machine is equipped with the following signal delay citcuit. When REV switch (S303) is depressed ("A") during forward projection, the REVERSE signal "H" transmitted from the pin ⑭ of Q201 controls the base voltage of Q232 by means of Q233 (timer IC), and delays the REVERSE signal "H" from the emitter for several seconds before transmitting from the collector. The portion marked with oblique lines in the "Timing Chart" below is the delay time.

Direct Change Timing Chart



• Cam Motor Pulse Circuit
Composed of Q208, D204, C222, C213 and R244, the pulse circuit has the following two functions.

1. It sends pulse signal for the cam motor to start. When the projector is at stop position, the operation cam ① is at [A] position shown in Fig. 51, turning the cam switch to ON with the rib section. On receiving the FORWARD (REVERSE) signal, the pulse circuit transmits 1 pulse to the base of Q206, turning Q206 to ON and rotating the cam motor for 1 pulse time (1.5 ~2 secs.). During that period, the rib section of ① that is pushing ② is shifted to [B] position to turn ② to OFF. In other words, the pulse from the pulse circuit rotates the cam motor only for changing over the cam switch (S204) from N. O. to N. C. When the cam switch is set to N. C., the negative side of motor gets grounded, causing the motor to rotate continuously. Then ① shifts the link (1), and after taking one turn (rotation), it pushes ② with the rib section, setting ② from N. C. to N. O. This causes the resistance R306 (120 Ω, 2W) to be connected between the two terminals of the motor and applies brake to the motor, stopping ① at a specified position.

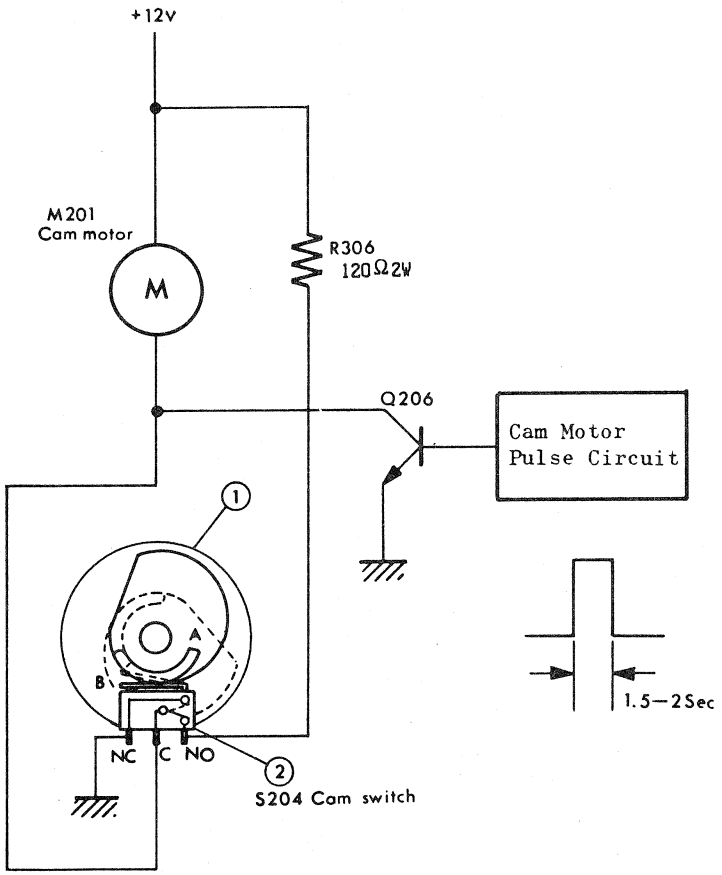


Fig.51

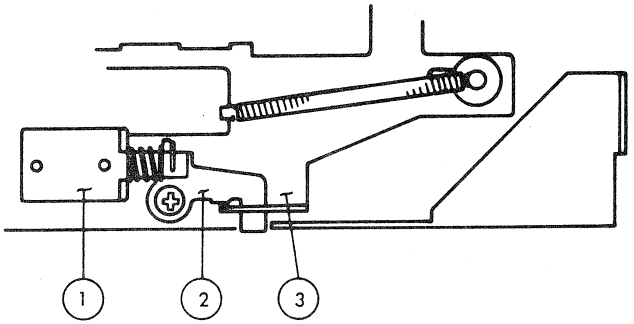
2. It determines the operation time of pad solenoid (SL203) at reverse projection. The middle tension roller, pad roller and brake roller must be held at projection STOP position at reverse projection. Since these rollers operate as the reverse lever shifts, the pulse circuit activates the pad solenoid ① to prevent the reverse lever ② from moving during the time the end of link (1) ③ shifts from [A] to [B] as shown in Fig. 52. It shall be noted here that 24 V is applied to the solenoid with rated voltage of 12 V in order that the pad solenoid might activate more surely. Accordingly, voltage is applied only for a short time (1 pules time = 1.5 ~ 2 sec.) to prevent the solenoid from getting heated up. Refer to "Reverse Projection Mechanism in Ⅱ-1-3" on page 23 for the functions of links.

   The cam motor pulse circuit determines the pulse width time by means of R244 and C213.

- Duoble-push Prevention Circuit
  The Q218 and Q202 prevent the REV switch from functioning even when it is depressed while the operation cam is started by depressing the FWD switch. Since the pin ⑫ of P206 is grounded during the time the operation cam is running, R226 divides the base potential of Q218 through D234, turning Q218 to ON and then Q202 (power switch for MODE switch circuit) to OFF.

Stop Position



Reverse Position

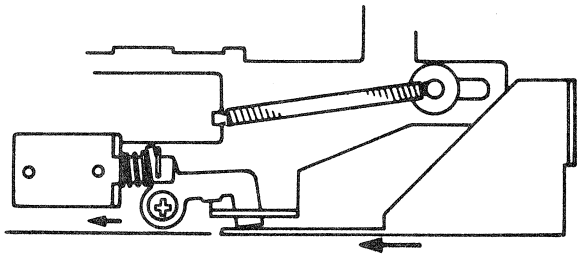


Fig.52

Ⅲ-2-7 Timing Chart

Because of logic control, the timing of representative points are indicated.

Fig. 53 shows the clock frequency of Q201 (TC9143P), which is 67Hz as can be read from the figure. (Calculated value: 72Hz)

The Hi-Low voltage of each point is measured in Fig. 54. It shall be noted here that the slenoids activare at LOW volatge. The figures in the chart indicate time (unit: second).

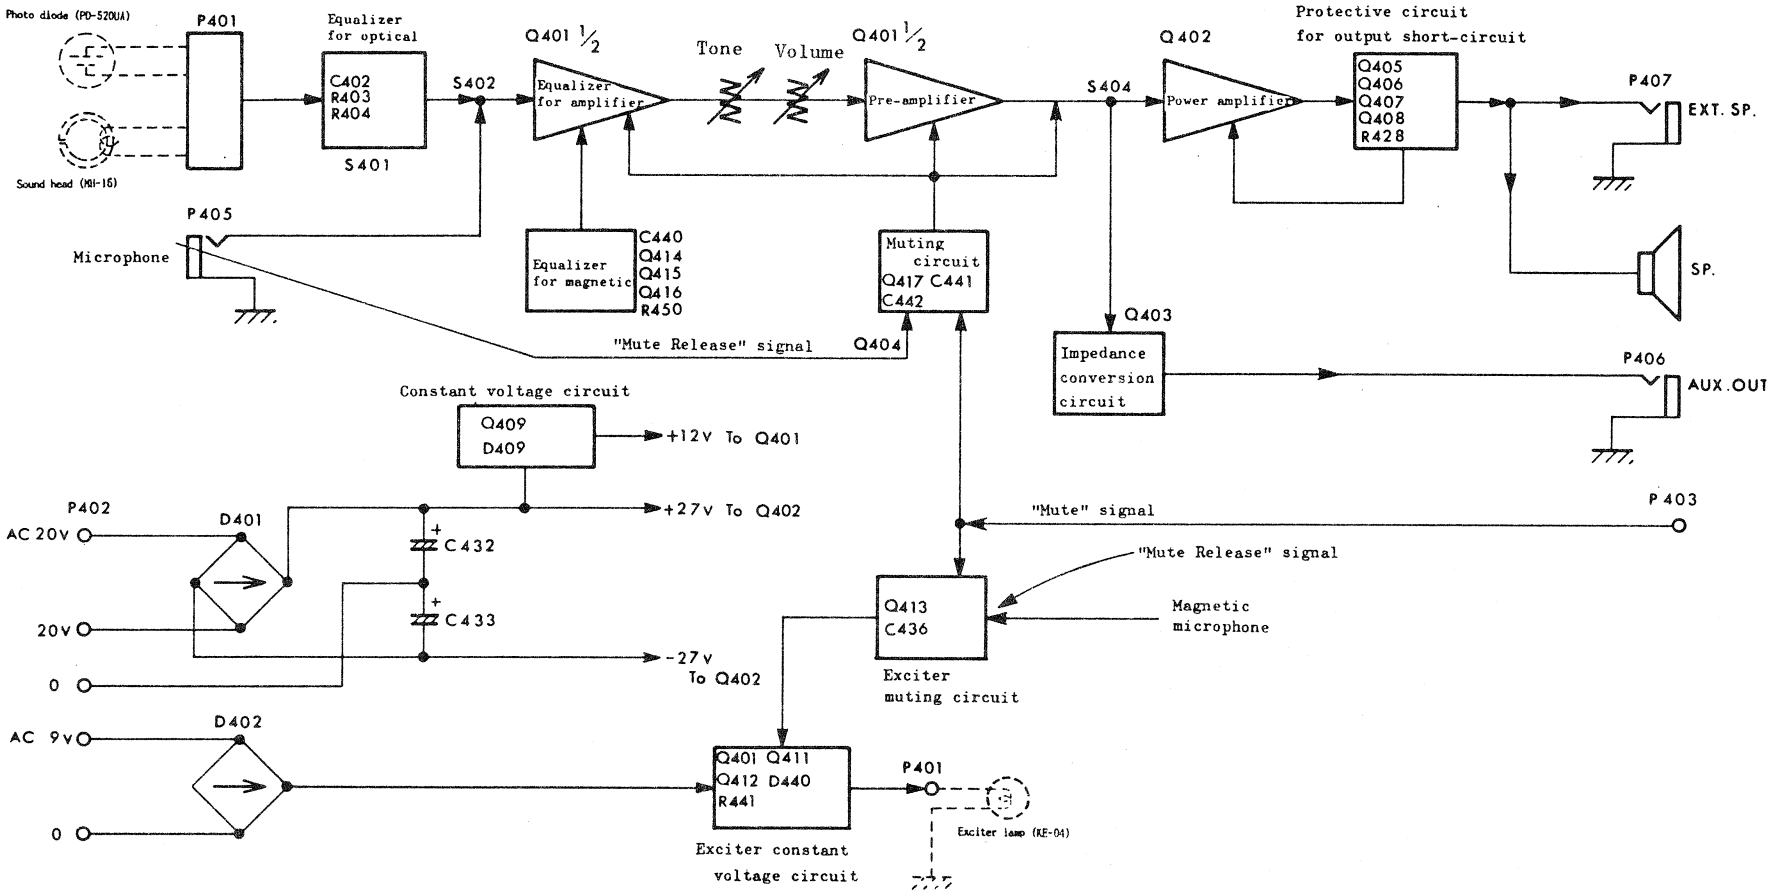
Ⅲ－3 Amplifier Circuit

This is an all IC amplifier with the rated output 25 W and the maximum output 30 W. The power IC (STK080) in the amplifier is driven by two power sourses (+ and -). The + power source with 12 V constant voltage is used as the power source for pre-IC. The equalizer amplifier and preamplifier are of 1-chip composition using 2 ch IC (TA7325P), having the gain of 40 dB respectively.

Ⅲ-3-1 Block Diagram for Amplifier Circuit



Ⅲ－3 Amplifier Circuit

Ⅲ-3-2 Signal Transfer for Optical Reproduction

The signal from solar battery (with load resistance: 22 k Ω) has its high zone uplifted (approx. 10 kHz + 4 dB) by the equalizer circuit composed of C402, R403 and R404, and amplified further (approx. + 40 dB) by the equalizer amplifier before entering into tone control circuit. The tone control circuit is a C-R type tone circuit and is used in numerous 16mm amplifiers. The circuit is a TREBLE variable circuit, and has the property (response) of max. + 5 dB, min. -10dB at 10kHz.
The signal, after passing through the tone circuit, gets into preamplifier to undergo flat amplification approx. + 40 dB before entering into power amplifier. The signal, amplified by the power amplifier, then passes through R 428(0.47Ω) before reaching the speaker. The R 428 is a resistance to detect the excess current of the output line when the output (sperker) is shorted.
Refer to page -- for short circuit protective circuit.

Ⅲ-3-3 Signal Transfer for Magnetic Reproduction

The signal from magnet head (with load resistance: 100 kΩ) undergoes LC resonance in C439 (1000 PF) to uplift 9 kHz. The semi-fixed resistance R458 (50k-B) located in series with C439 is a damping resistance, and adjusts the uplifting quantity (rate) of 9 kHz. The equalizer for magnetic reproduction from the equalizer curve with time constant of 70 μs by using the NFB (negative feed back) circuit of the equalizer amplifier. This circuit is composed of C440, R450 and R408, and increases the gain at 400 Hz signal reproduction by 15 dB higher than at optical reproduction by shorting R443.
The change-over from equalizer circuit for optical reproduction to equalizer circuit for magnetic reproduction and vice versa is carried out by means of the transistors Q414, Q415 and Q416. The signal transfer after the signal passes through the equalizer amplifier is the same as in the case of signal transfer for optical reproduction.

Ⅲ－3 Amplifier Circuit

Ⅲ-3-4 Microphone Circuit

When the microphone is inserted into the microphone jack (P405), the switch of S402 changes the circuits then cuts off the signal for optical and magnetic reproductions and connects the microphone circuit. It also breaks off the power source to the transistor (Q414) for magnetic equalizer circuit change-over, and composes the equalizer circuit special to the microphone. Furthermore, since Q401 is turned to OFF due to the muting function in cases other than forward projection, the S402 "-1" also turns Q404 to ON and grounds the muting signal in order to cut off the muting circuit.
When the exciter lamp is lit up, the base of Q411 is grounded to extinguish the lamp by turning Q413 in the exciter circuit to ON.

Ⅲ-3-5 Auxiliary Output Circuit

The auxiliary output terminal (P406) transmits signal by means of the jack with size ϕ3.5mm. The signal then carries out impedance conversion of the preamplifier output by means of 1-step emitter follower circuit, corresponding to the load of 600 Ω. The optput level can by varied by the VOLUME, with max. 0 dBm obtainable at the load of 600 Ω.
When the auxiliary output terminal is used, the S404 changes over and the power IC is cut off so that no sound comes from the built-in or/and external speaker.

Ⅲ-3-6 Exciter Lamp Circuit

This circuit forms 4 V power source for exciter by means of the constant voltage circuit (Q410, Q411, Q412 and D410。
The 4 V emitter output of Q410 can be adjusted (regulated) by means of the semi-fixed resistance R441 (1k-B). The circuit, getting interlocked with sound muting circuit, also turns the exciter lamp on or off. This is done by turning the output of Q410 to ON or OFF by controlling the base voltage of Q411 in constant voltage circuit by means of Q413. The exciter lamp is made to extinguish instantaneously and to light up gradually with the time constants of C436 and R437, thus carrying out muting by means of exciting lamp as well as the other muting circuits for preventing unfavorable sound from the speaker.
The exciter lamp is lit up only during forward projection.

Ⅲ-3-7 Muting Circuit

Muting signal is transmitted from the pin ⑪ of Q201 in control circuit. This signal is "L" (low) only for FORWARD mode; for other modes it is "H" (high).
The signal transmitted from ⑪ of Q201 passes into amplifier and exciter circuits through P403. In amplifier circuit, the signal transfers into the pin ⑨ of Q401 (TA7325P). This circuit is used because when a voltage over 0.9 V is applied in the pin ⑨ of Q401, it turns the power (output) to OFF by cutting off the bias circuit in the IC. However, since this circuit alone can not prevent the unfavorable sound from the speaker, muting is carried out by turning Q417 to ON. The above circuits are set not to operate when microphone is used at modes other than FORWARD.
Refer to "Microphone Circuit" on preceding page.
The signal in the exciter circuit transfers to the base of Q413, grounding the base of Q411 by turning Q413 to ON and then turning Q410 to OFF. It also mutes the exciter, when microphone is used, by turning Q413 to ON. Fig. 61 shows the timing chart for mute signal (upper curve), exciter voltage (center curve) and sound output (lower curve). The points of measurement are ① of P403 for mute signal, emitter of Q401 for exciter voltage and SP. OUT for sound output.
When muting circuit is turned to ON (left-hand-side in Fig. 61), the voltage of mute signal rises up, muting the exciter first and then (shortly later) the sound output. This delay of approximately 0.1 second is due to C441 and C442 for the countermeasure against unfavorable sound.
When muting circuit is turned to OFF. (i.e. when muting is released) as shown on the right-hand-side of Fig. 61, the sound and exciter rise up approximately 2 seconds after the voltage of mute signal drops to "L." This delay is for eliminating the sound irregularity at the time of rise of flywheel.

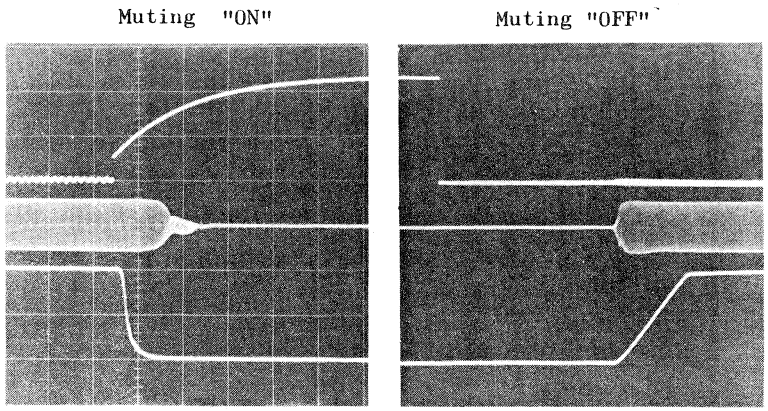


Fig.61

Ⅲ－3 Amplifier Circuit

Ⅲ-3-8 Speaker Safety Circuit

Most of the conventional projector amplifiers, with output less than 20 W, could be safely protected from power short circuit simply by means of the fuse because of the large internal endurance of the IC. However, since the 30 W output of this projector makes the internal endurance of power IC inadequate, the projector is provided with a current control type electronic safety circuit, the function of which is described below.

Since this circuit is vertically symmetrical with the pin ⑦ of power IC (STK 080) and carries out same function, only half cycle of the circuit will be described here.

When the speaker output is grounded (earthed), the short-circuit current flows through R428 (0.47 Ω). Supposing this current to be 2.6 A, a voltage of 1.2 VRMS (0.47Ω x 2.6 A = 1.2 V) generates at both terminals of R428, and since Q406 is not turned to ON, this voltage gets divided in R427 and R456, causing the current to flow to the base of Q405 and turning Q405 to ON. This grounds the pin ⑨ of Q402 and distributes the base current of IC driver, and thus the output current of IC is controlled (limited) to 2.6 A. Fig. 62 shows the power source and signal curves when output is shorted. The points of measurement are the pin ⑧ of Q402 at positive side of the power source (0.5 V/DIV) in the case of upper curve, the pin ⑦ of Q402 at 400 Hz signal (VOL-MAX) in the case of center curve and the pin ⑥ of Q402 at negative side of the power source (0.5 V/DIV) in the case of lower curve.

The power current at one side, with the input 40 dB VOL-MAX (22 VRMS - 8Ω), is 1.2 A AC (and is 0.8 A AC at the rated value of 14 V RMS-8 Ω). Here, if both terminals of the load (8 Ω) are shorted, the sound output (actually of 1.2 V RMS) gets virtually reduced to zero, as shown in the right-hand-side of Fig. 62, with the power current at one side in this case being 1.3 A. Furthermore, there is no change in the power ripple. In other words, the power current is controlled to 1.3 A by means of the safety circuit, which activates and controls the output current of the pin ⑦ of Q402. Hence, the IC is safe from getting heated up and the power source fuse does not break off even when both terminals (ends) of speaker are shorted by mistake.

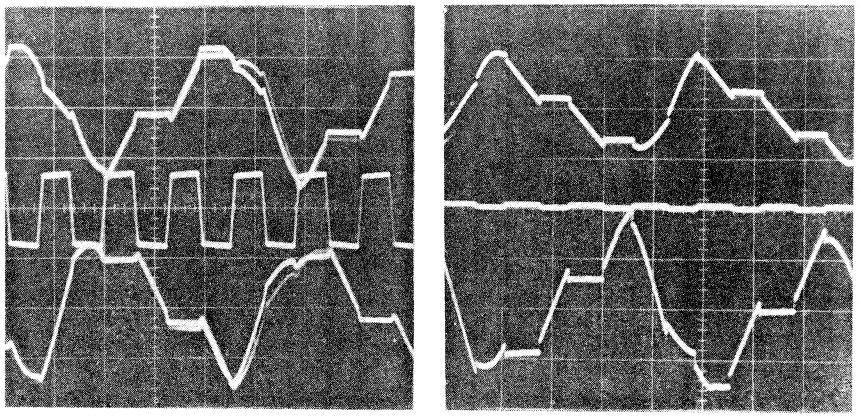

Fig.62

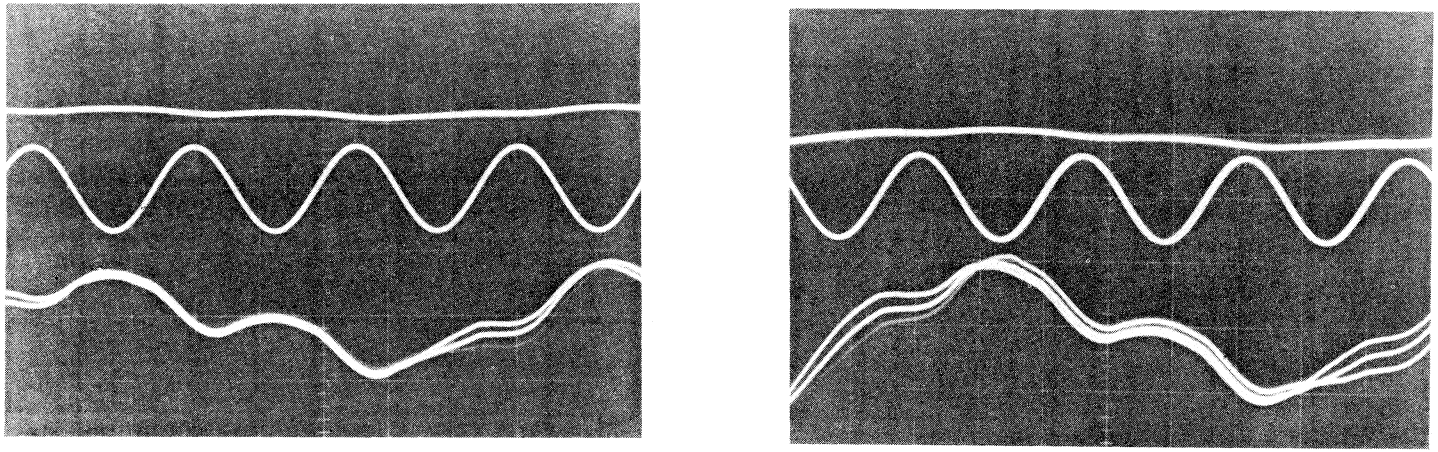
Ⅲ-3-9 Others

The positive power 27 V for amplifier is provided by the pin ⑧ of 8 P DIN jack (P301) for remote control. The maximum current capacity is·300 mA, and within this range it can also be used as the power source for other circits. However, when using for other circuits, use the external earth of DIN jack, not the pin ⑤ of DIN jack. Fig. 63 shows the curves of power voltage (upper curve), 400 Hz signal wave (center curve) and power ripple (lower curve) when 300 mA is passed.

When pin 8 of 8p DIN jack has no load

1 mSec/DIV

When 300 mA is passed

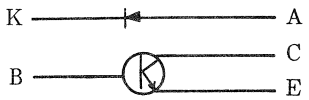


DC power voltage	5V/DIV	26.3V	⟶	25.0V	Upper curve
400 Hz SP output curve	Distotion	0.3%	⟶	0.4%	Center curve
Power ripple	0.5V/DIV		⟶		Lower curve

Fig.63

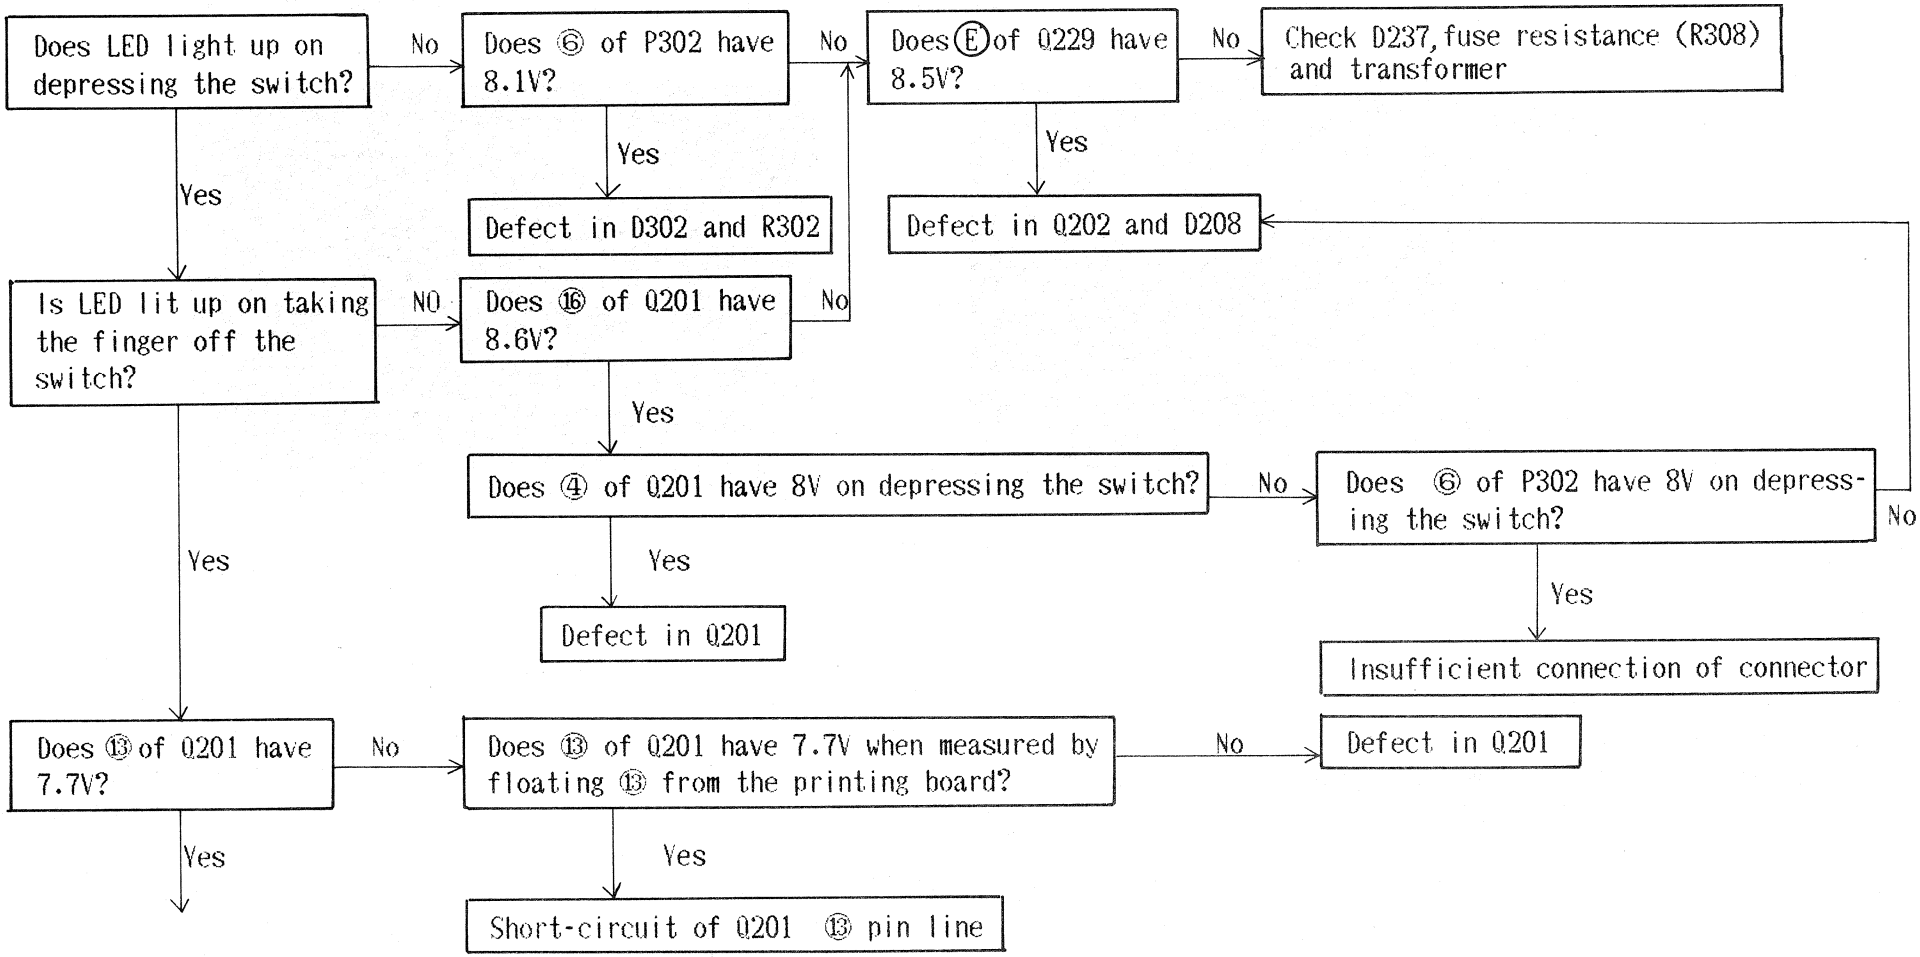
Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

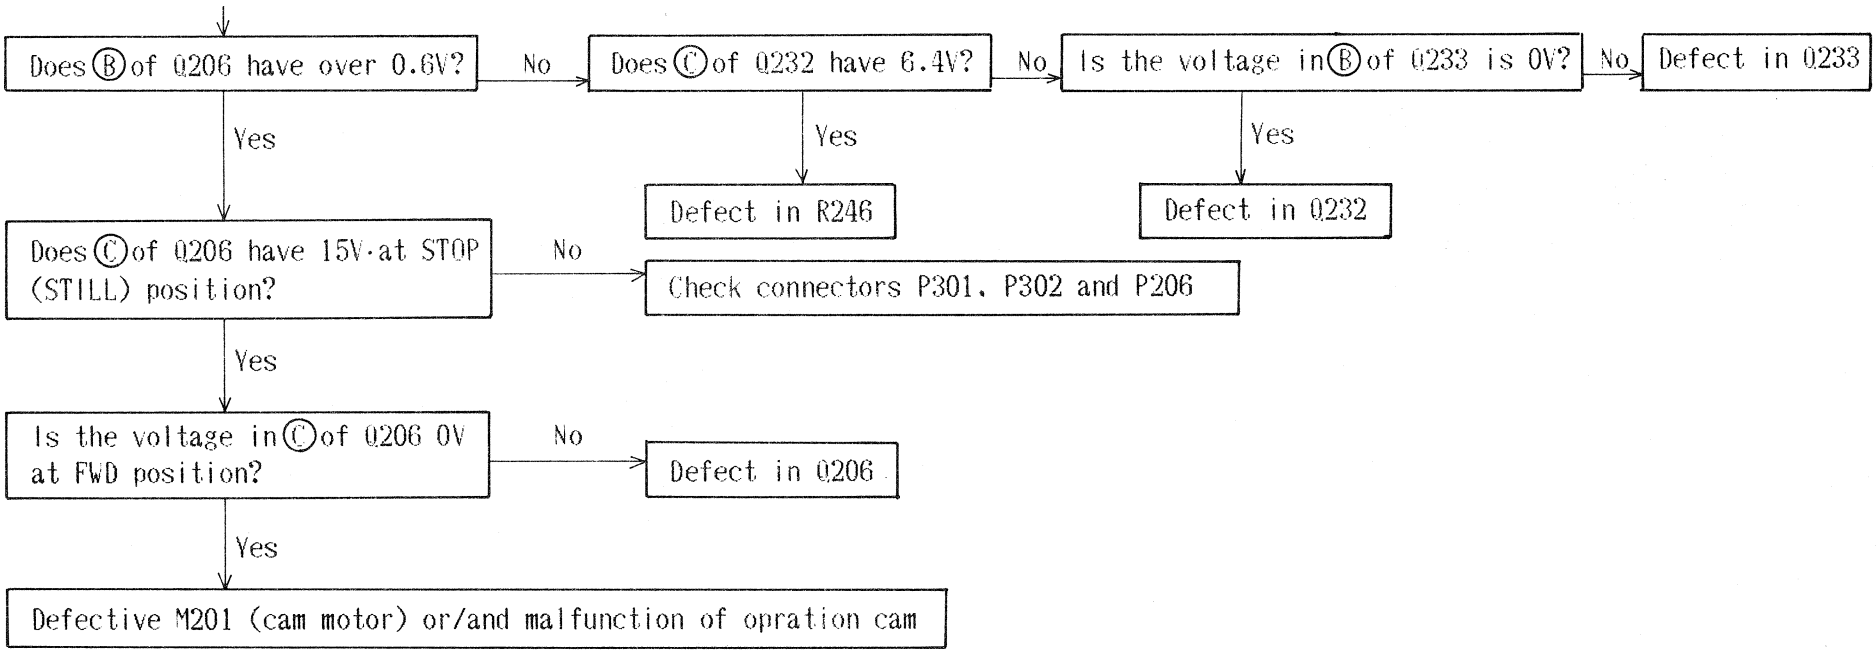
Notes: The numbers inside ○ in the sentences indicate the numbers of IC and connector terminals.
Ⓐanode of diode, Ⓚcathode of diode,
Ⓑbase of transistor, Ⓒcorrector of transistor,
Ⓔemitter of transistor.



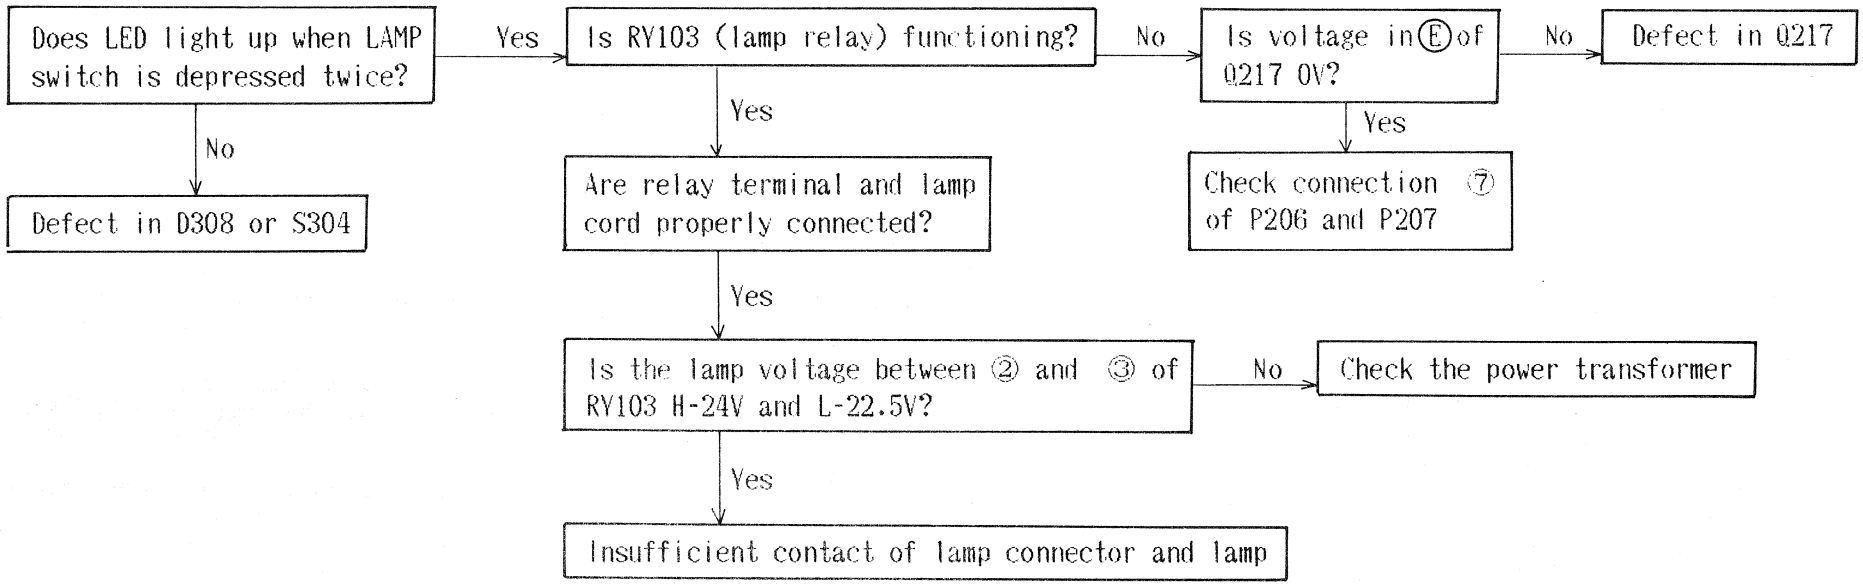
Ⅲ-4-1 Control Circuit Trouble-shooting

The circuit does not function even when FWD (REV) switch is depressed. (Check the connection of connectors P206 and P302.)



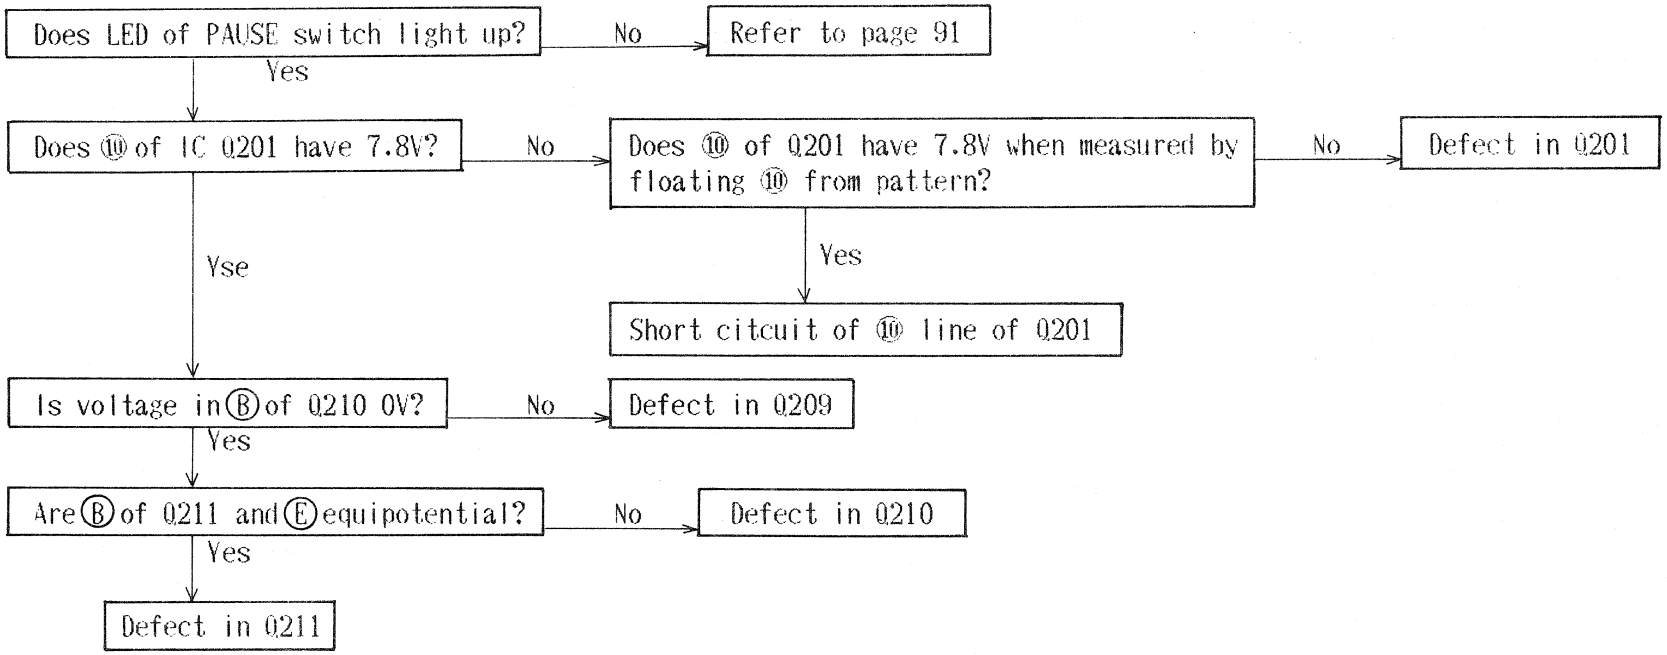


• Lamp does not light up even when LAMP switch is depressed (normal film feed)

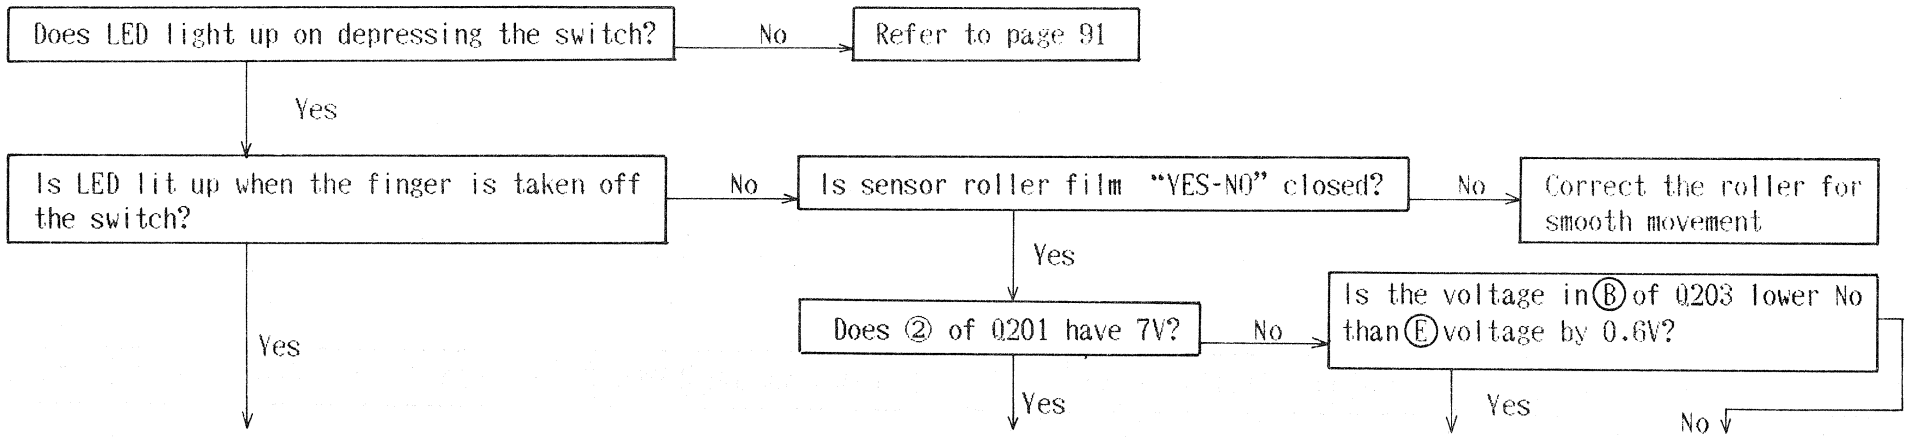


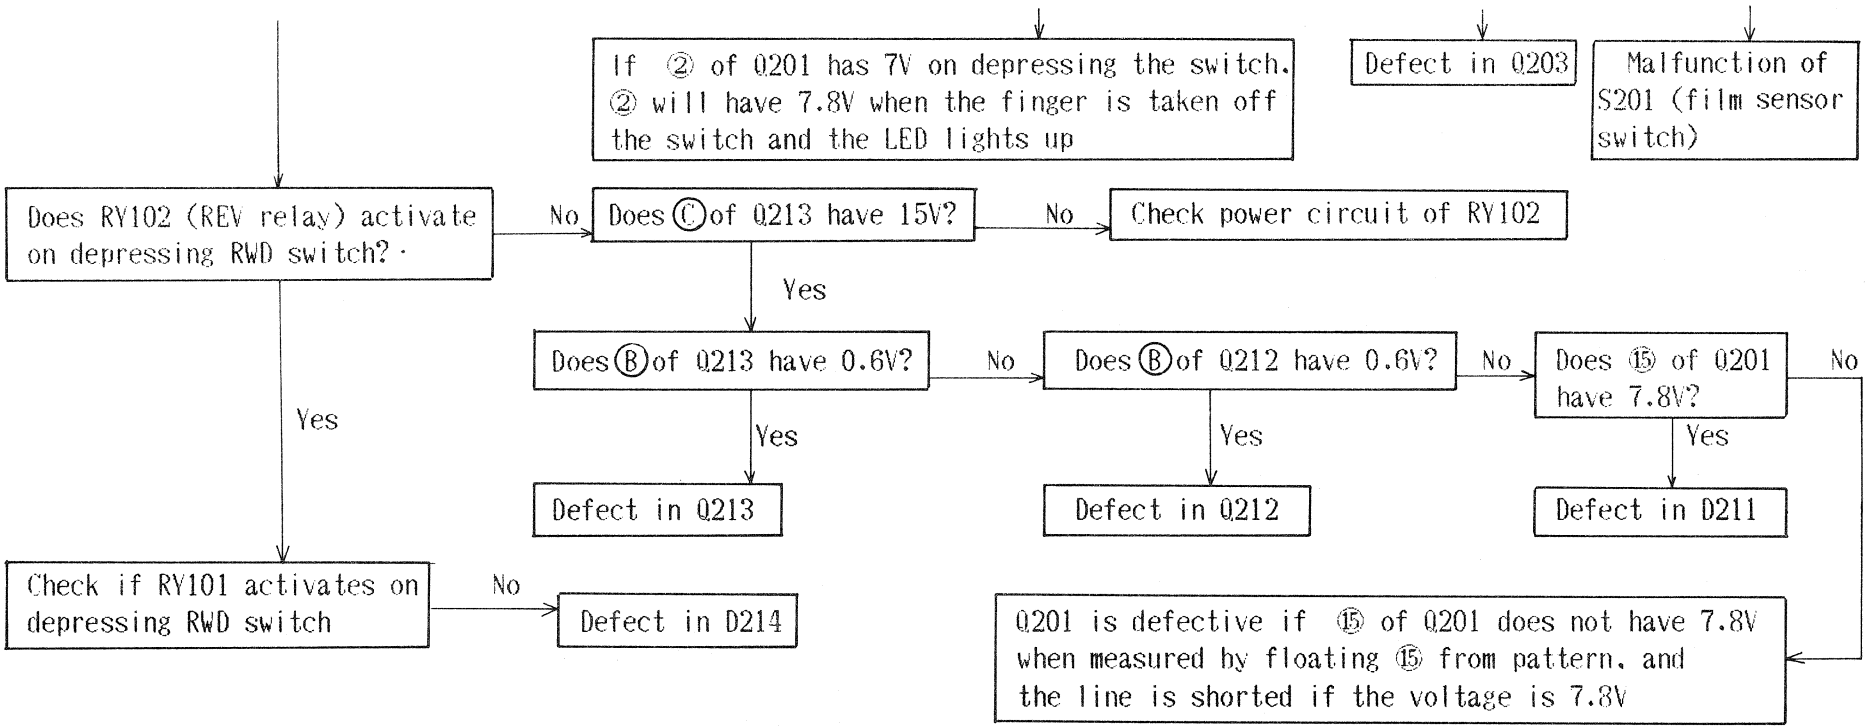
Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

- Does not set to PAUSE

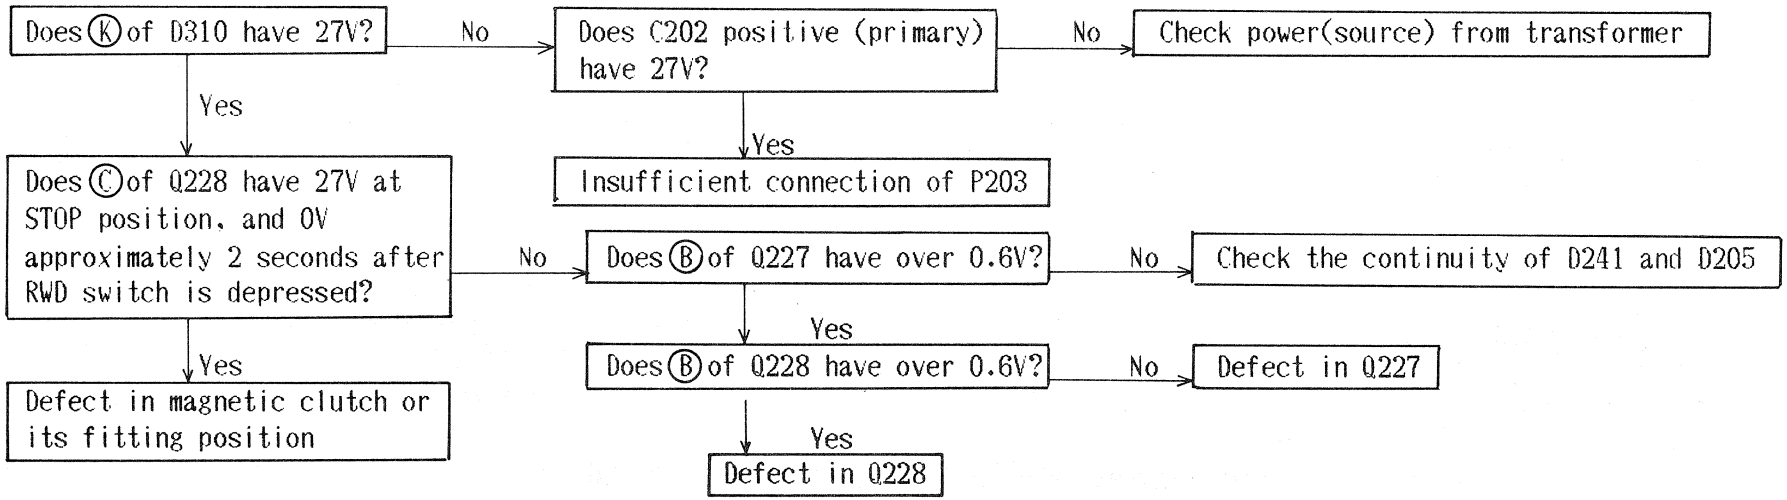


- Does not operate even when rewind switch (RWD) is depressed. (FWD and REV being normal)



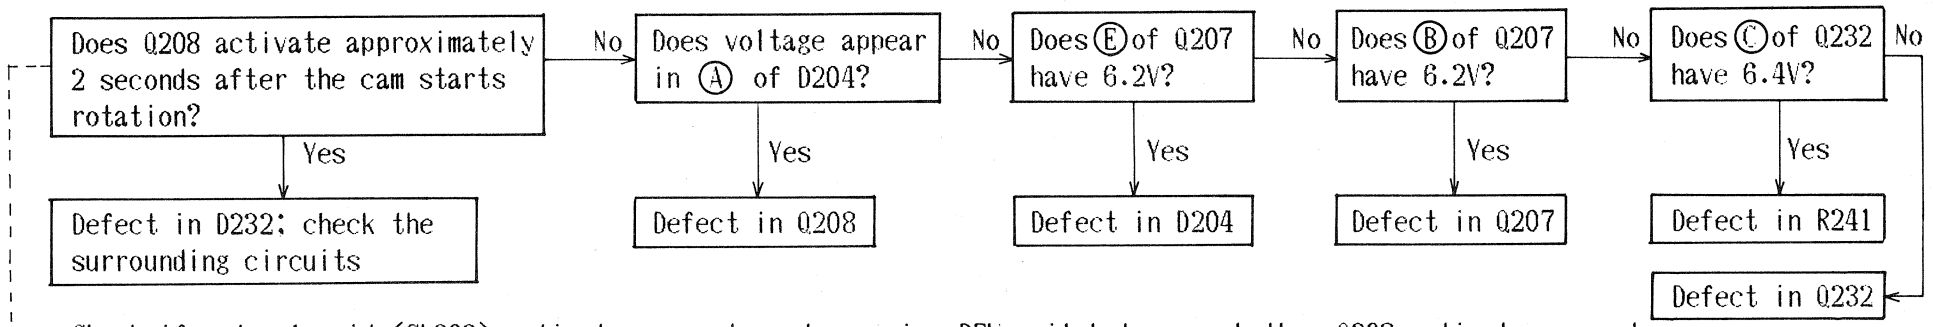


• Magnetic clutch (MC201) fails to function at rewinding

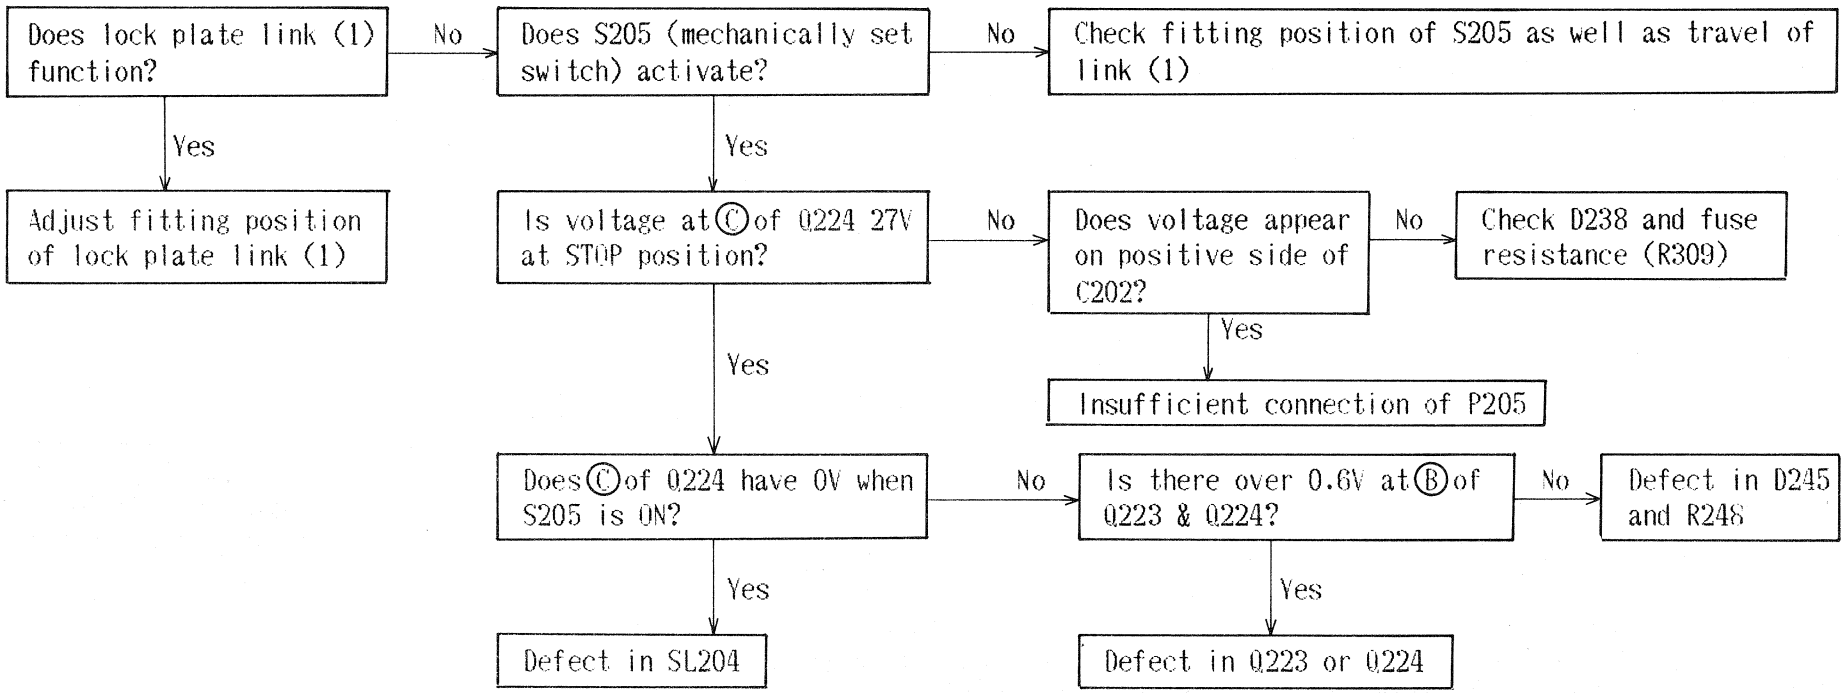


Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

- Operation cam continues rotating

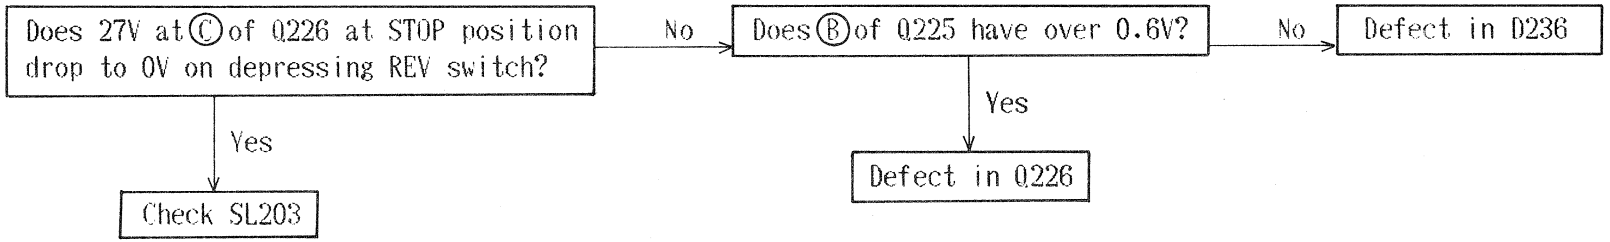


- Link does not lock.



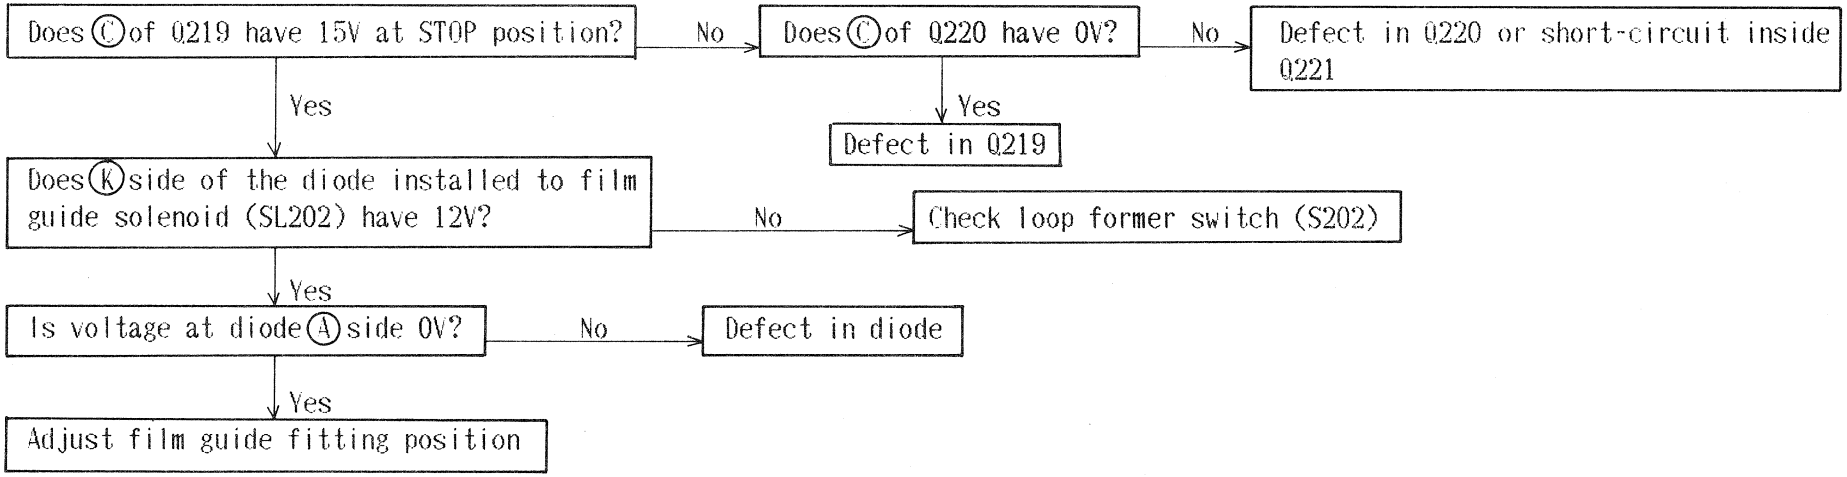
Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

- SL203 (pad solenoid) does not draw at reverse projection.



- SL203 (pad solenoid) continues drawing at reverse projection → Defect in D233

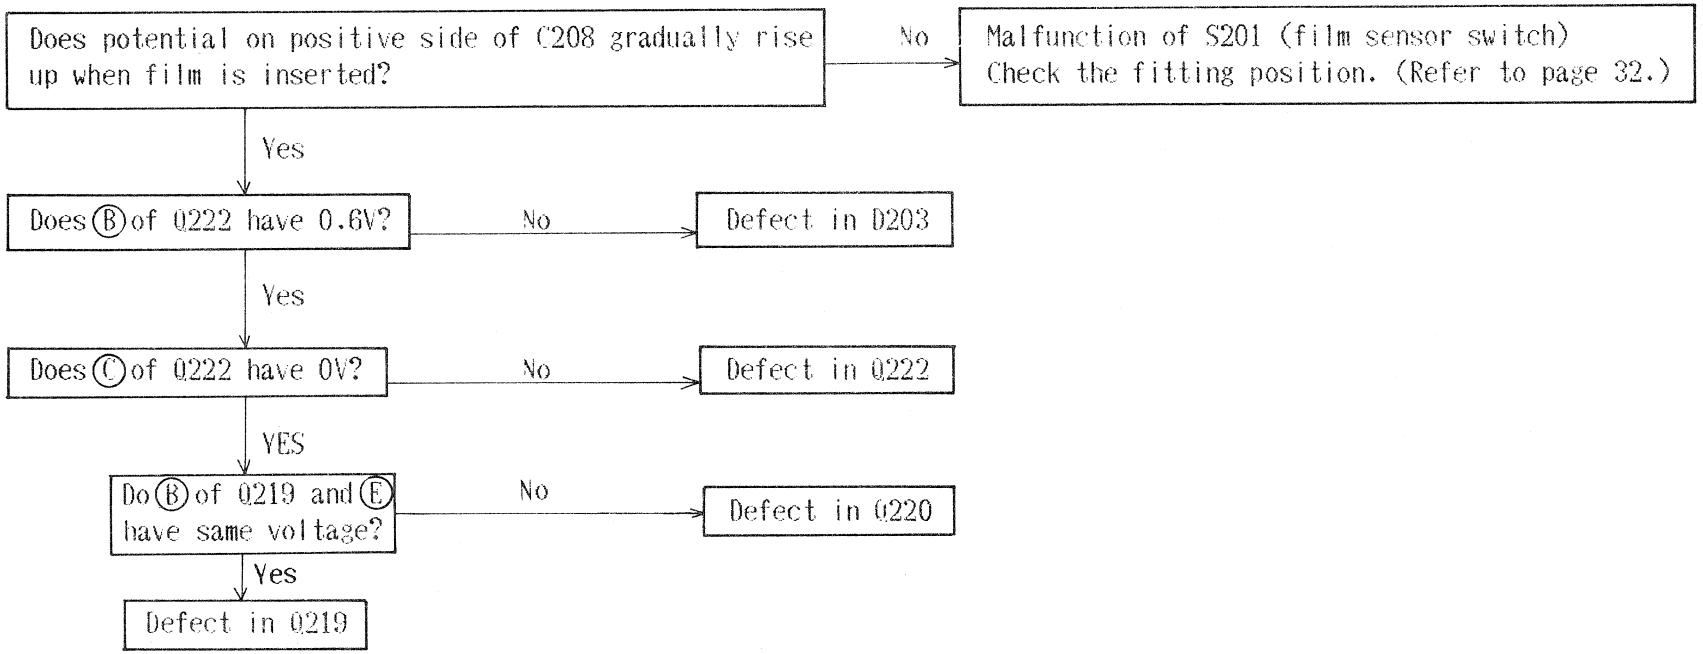
- Does not set to loading position even when LOOP FORMER is depressed (with forward/reverse being normal).



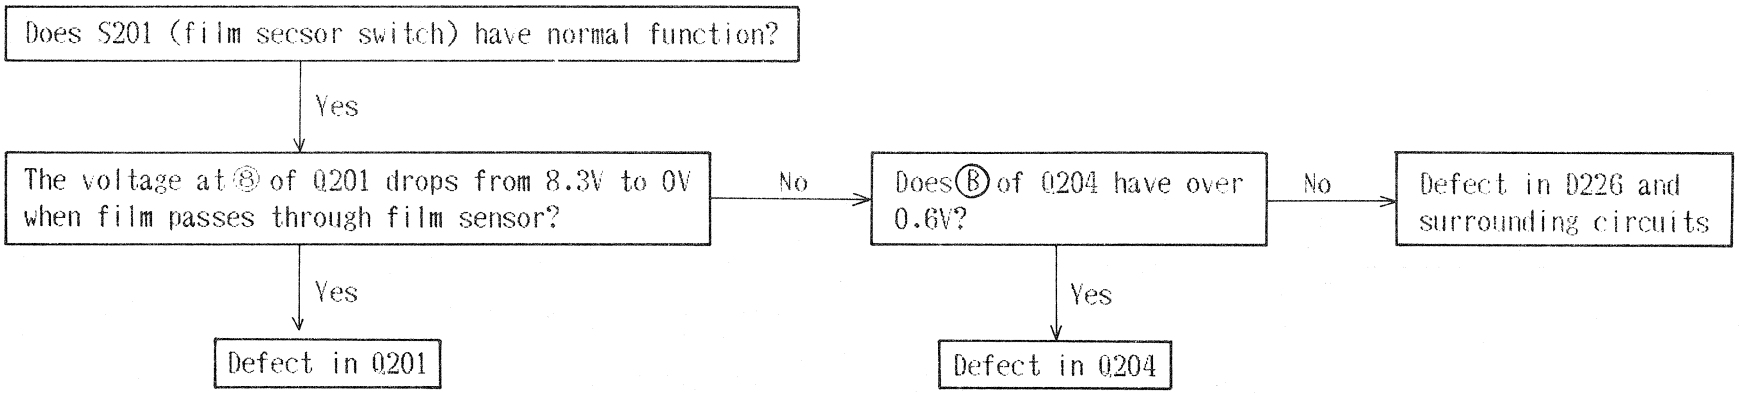
Adjust the film guide fitting position so that the film guide, at automatic loading, is drawn to the base frame side due to SL202 until the guide touches the ends (tips) of shaft lever guide roller (4) and shaft brake roller (3), without interfering the guide roller (4), holder sound lens, guide roller (1) on lever, guide roller (3), film guide pin, etc. Furthermore, adjust the fitting position of holding plate plunger film guide so that the winding section of SL202 and plunger comfortably fit with each other. It is, however, necessary (desirable) to replace the film guide itself when the gap between stopper i.e. shaft brake roller(3) and film guide, on pressing the holding plate plunger film guide fitting section at "automatic loading" position, is over 1mm, since in such case film guide is supposed to have large distortion.

Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

- Automatic stop (timer stop) mechanism does not function.

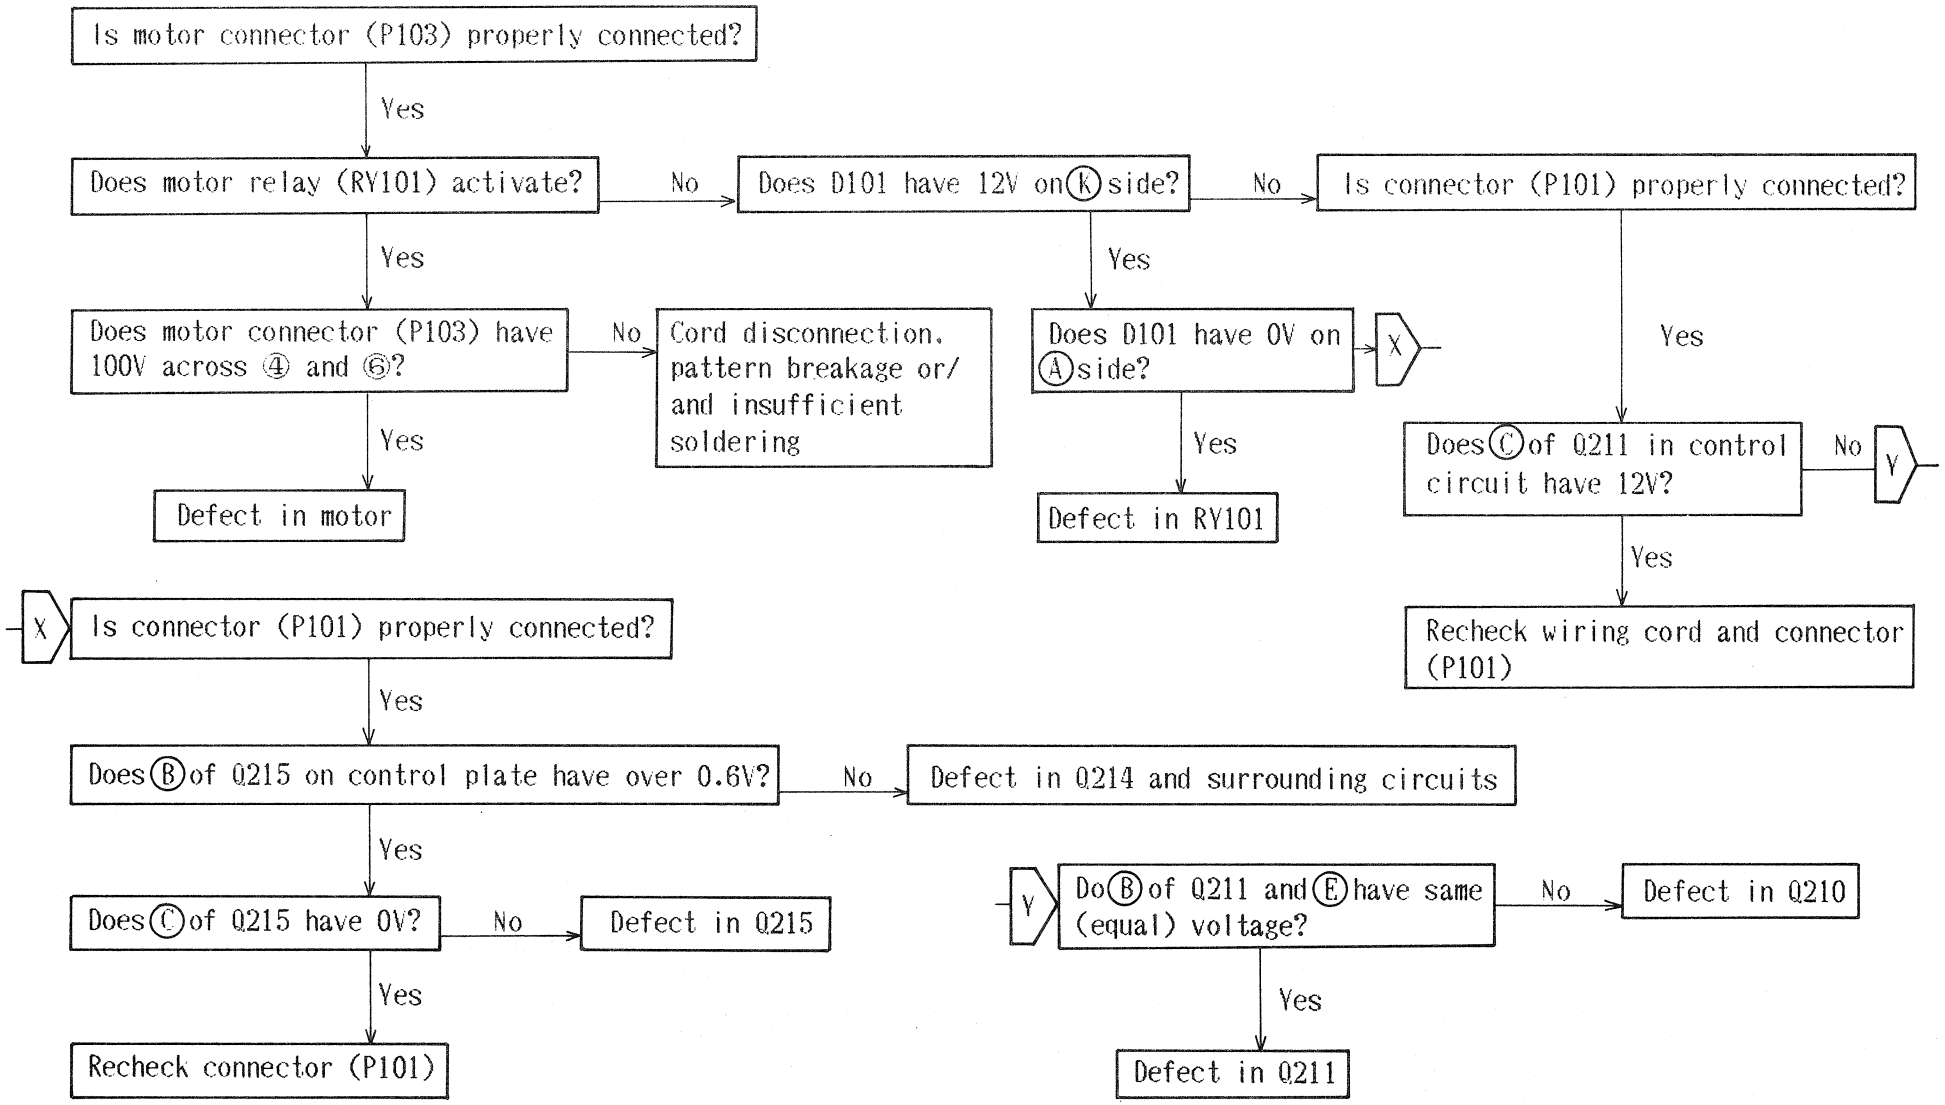


- AUTO STOP does not activate on completion of projection.



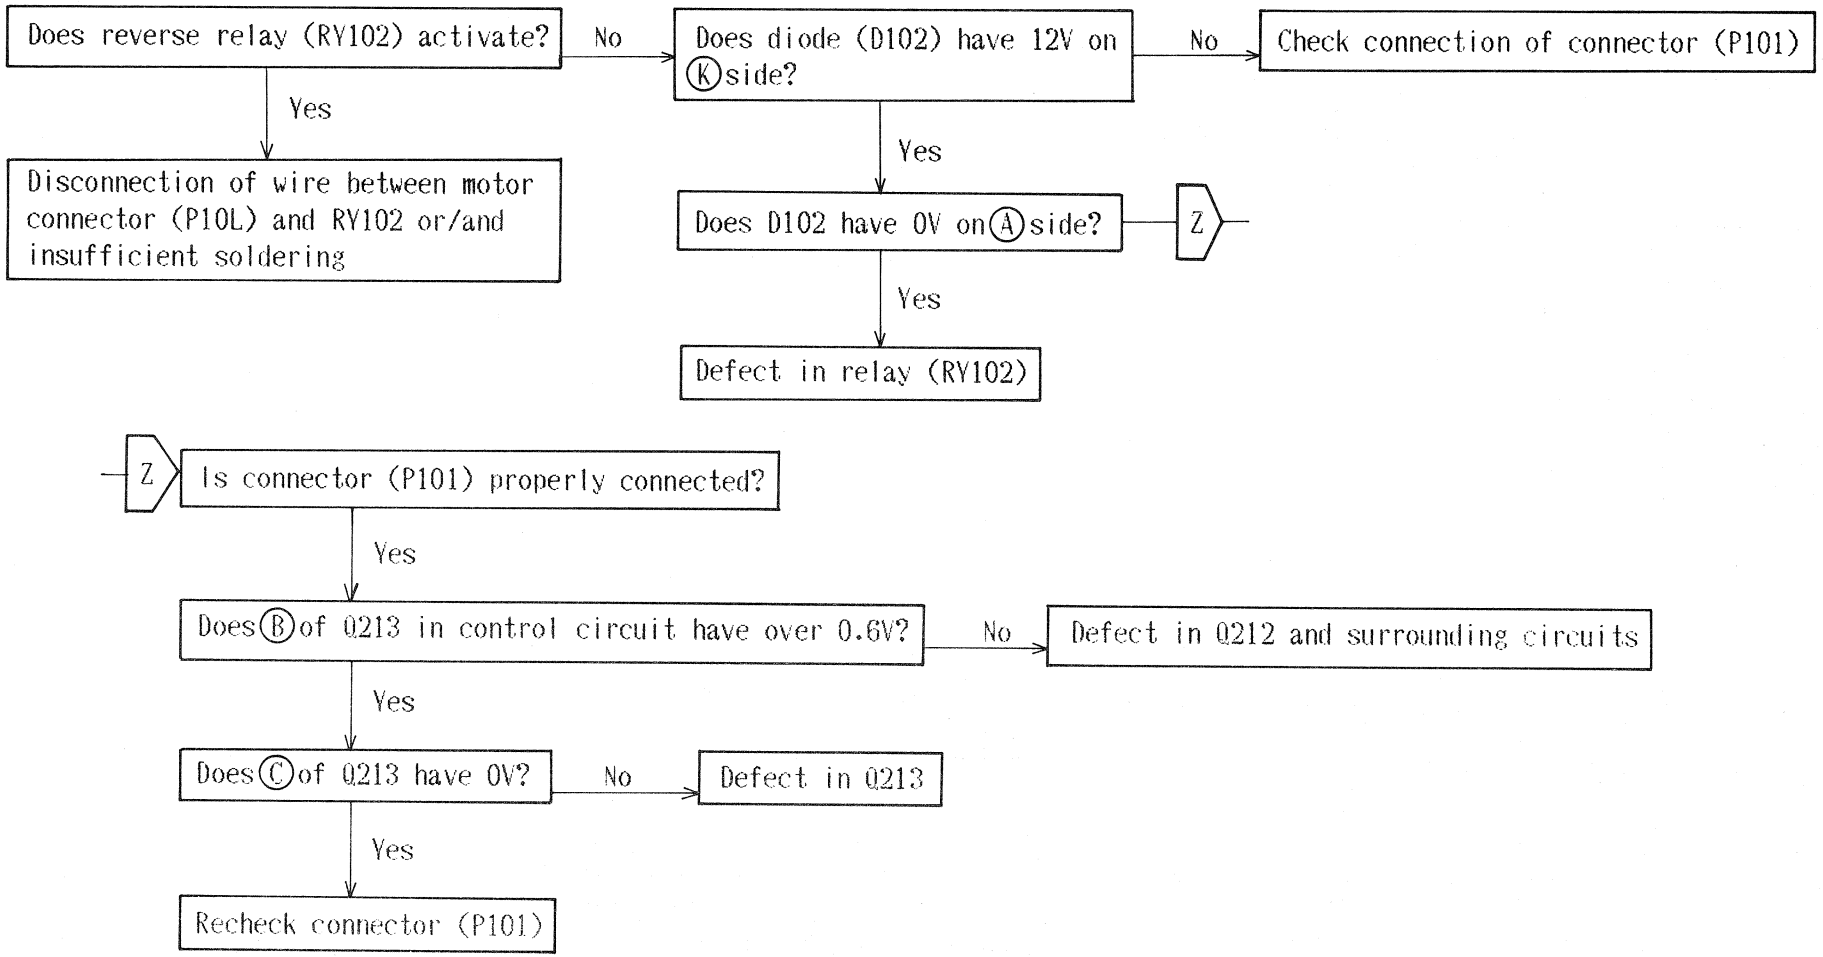
Ⅲ-4-2 Motor Circuit Trouble-shooting

- Forward (reverse) motor fails to operate (with links properly locked).



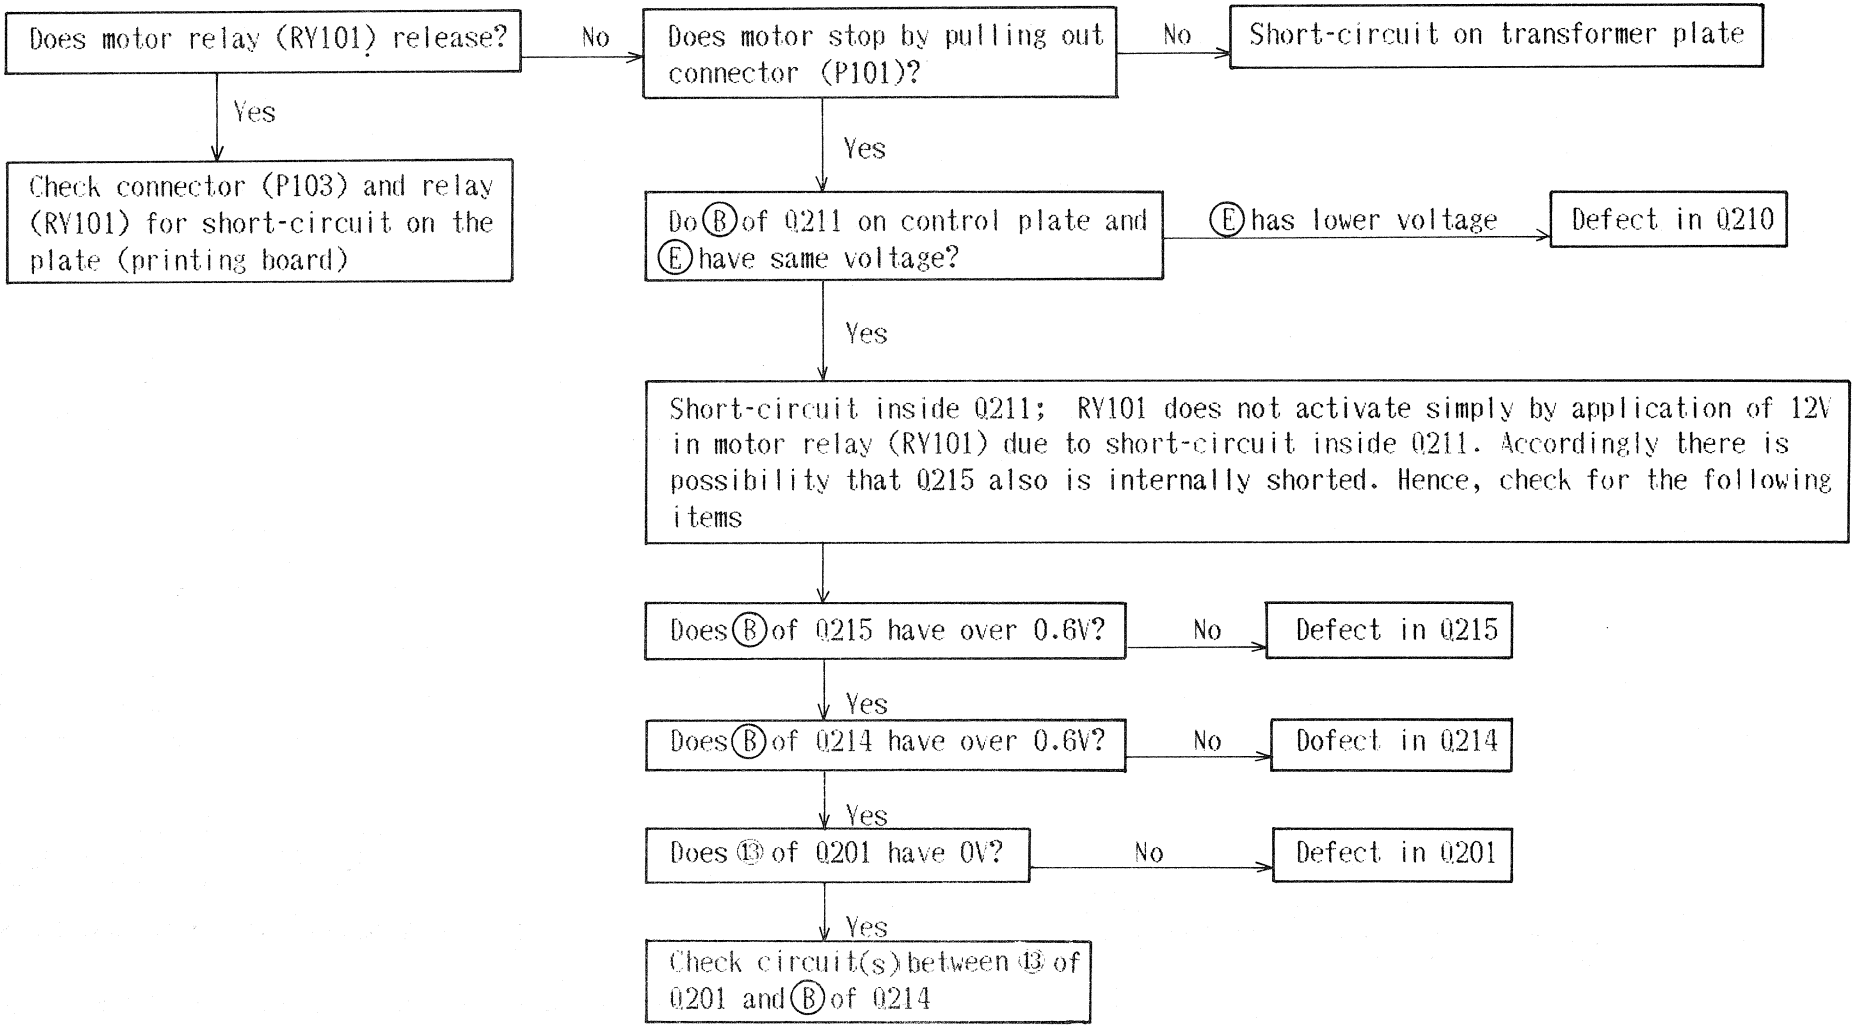
Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

- Motor has forward (normal) rotation even when REV switch is depressed.



Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

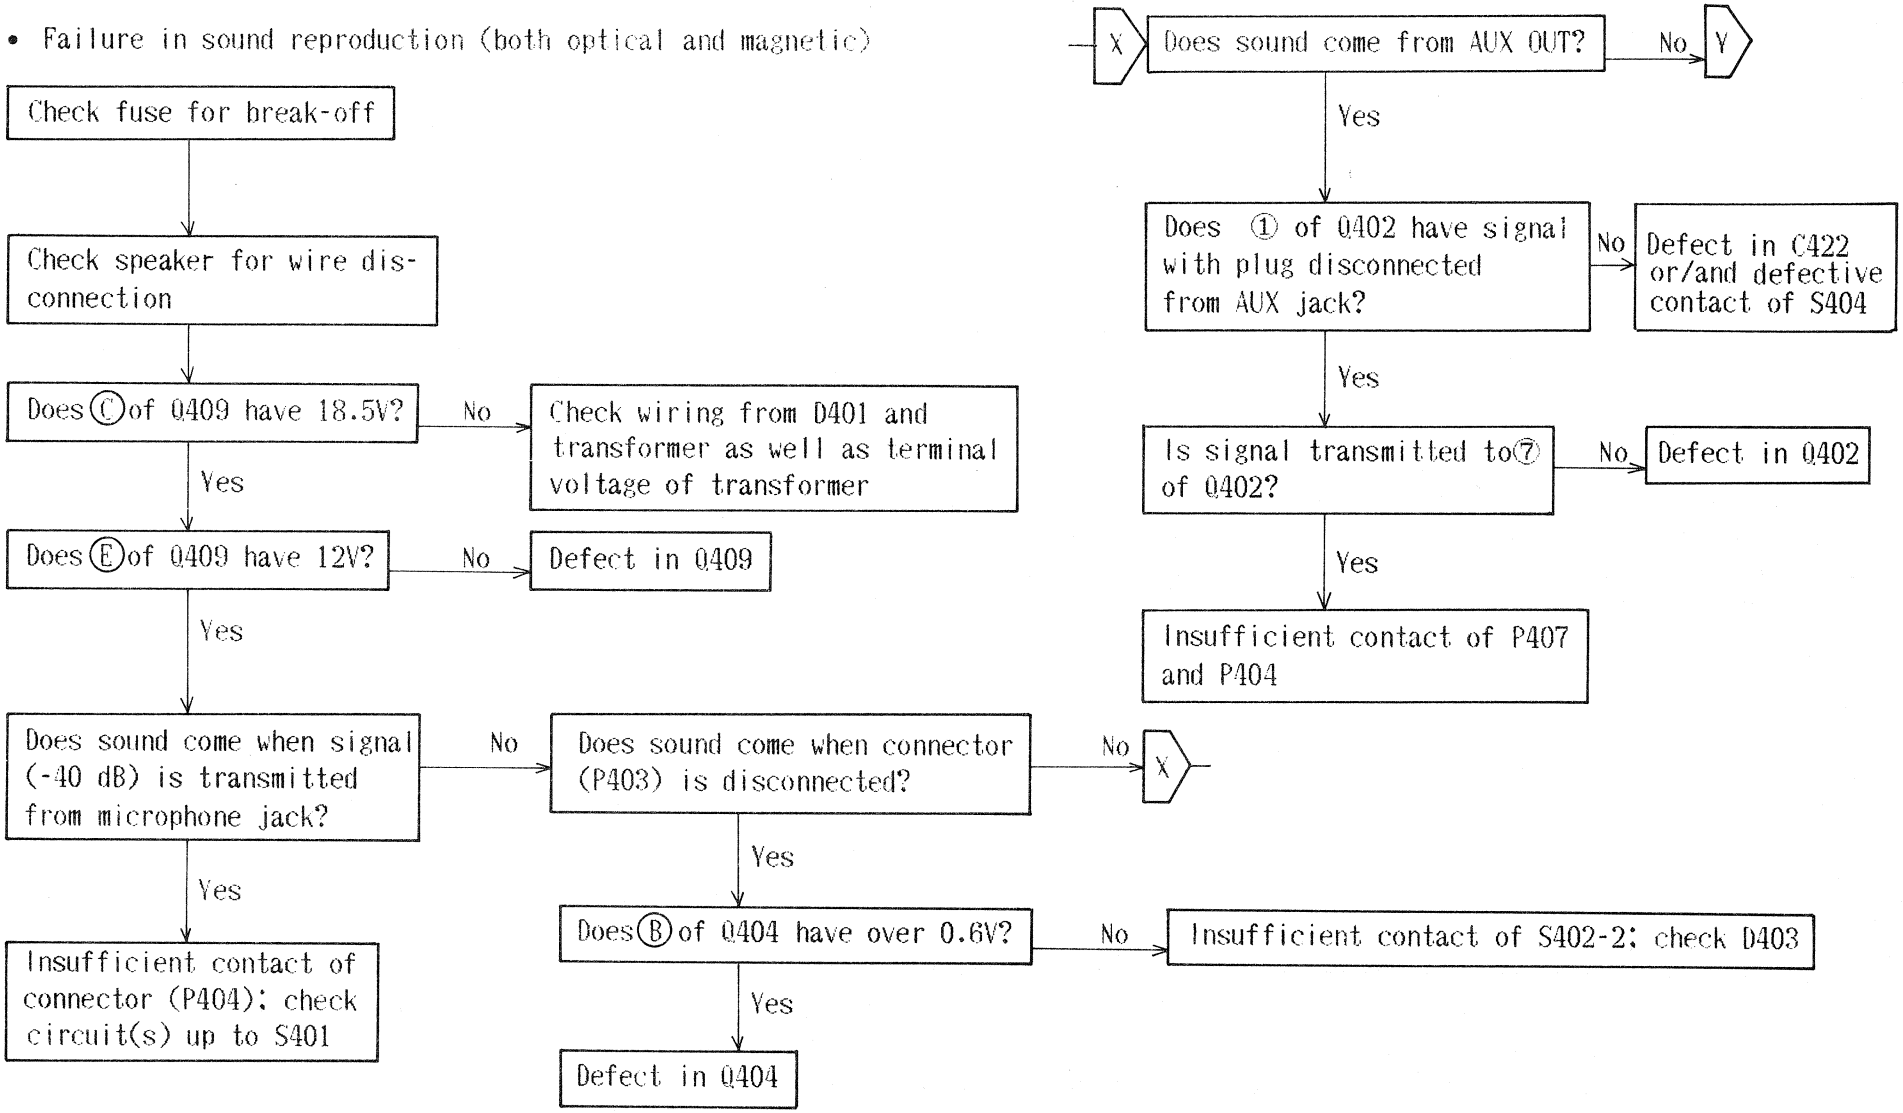
- Motor fails to stop (while links return to STOP positions).

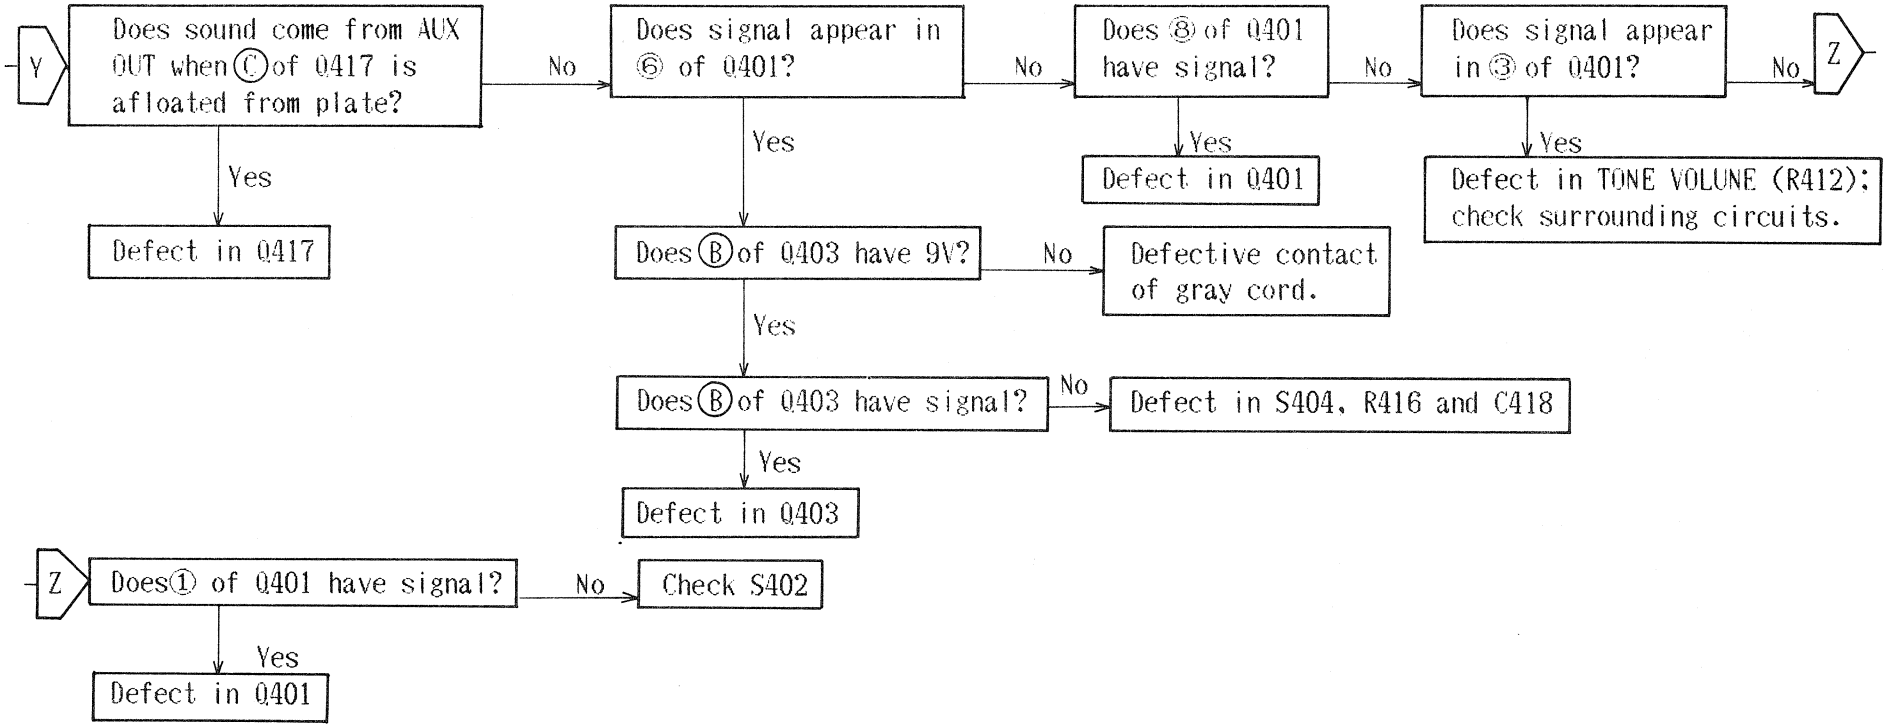


Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

Ⅲ-4-3 Amplifier Circuit Trouble-shooting

- Failure in sound reproduction (both optical and magnetic)





- Internal speaker fails to reproduce sound (sound reproduction is normal when external speaker is used).

Check voice coil of speaker for disconnection

↓

Check to see that cords are properly connected to speaker terminals

↓

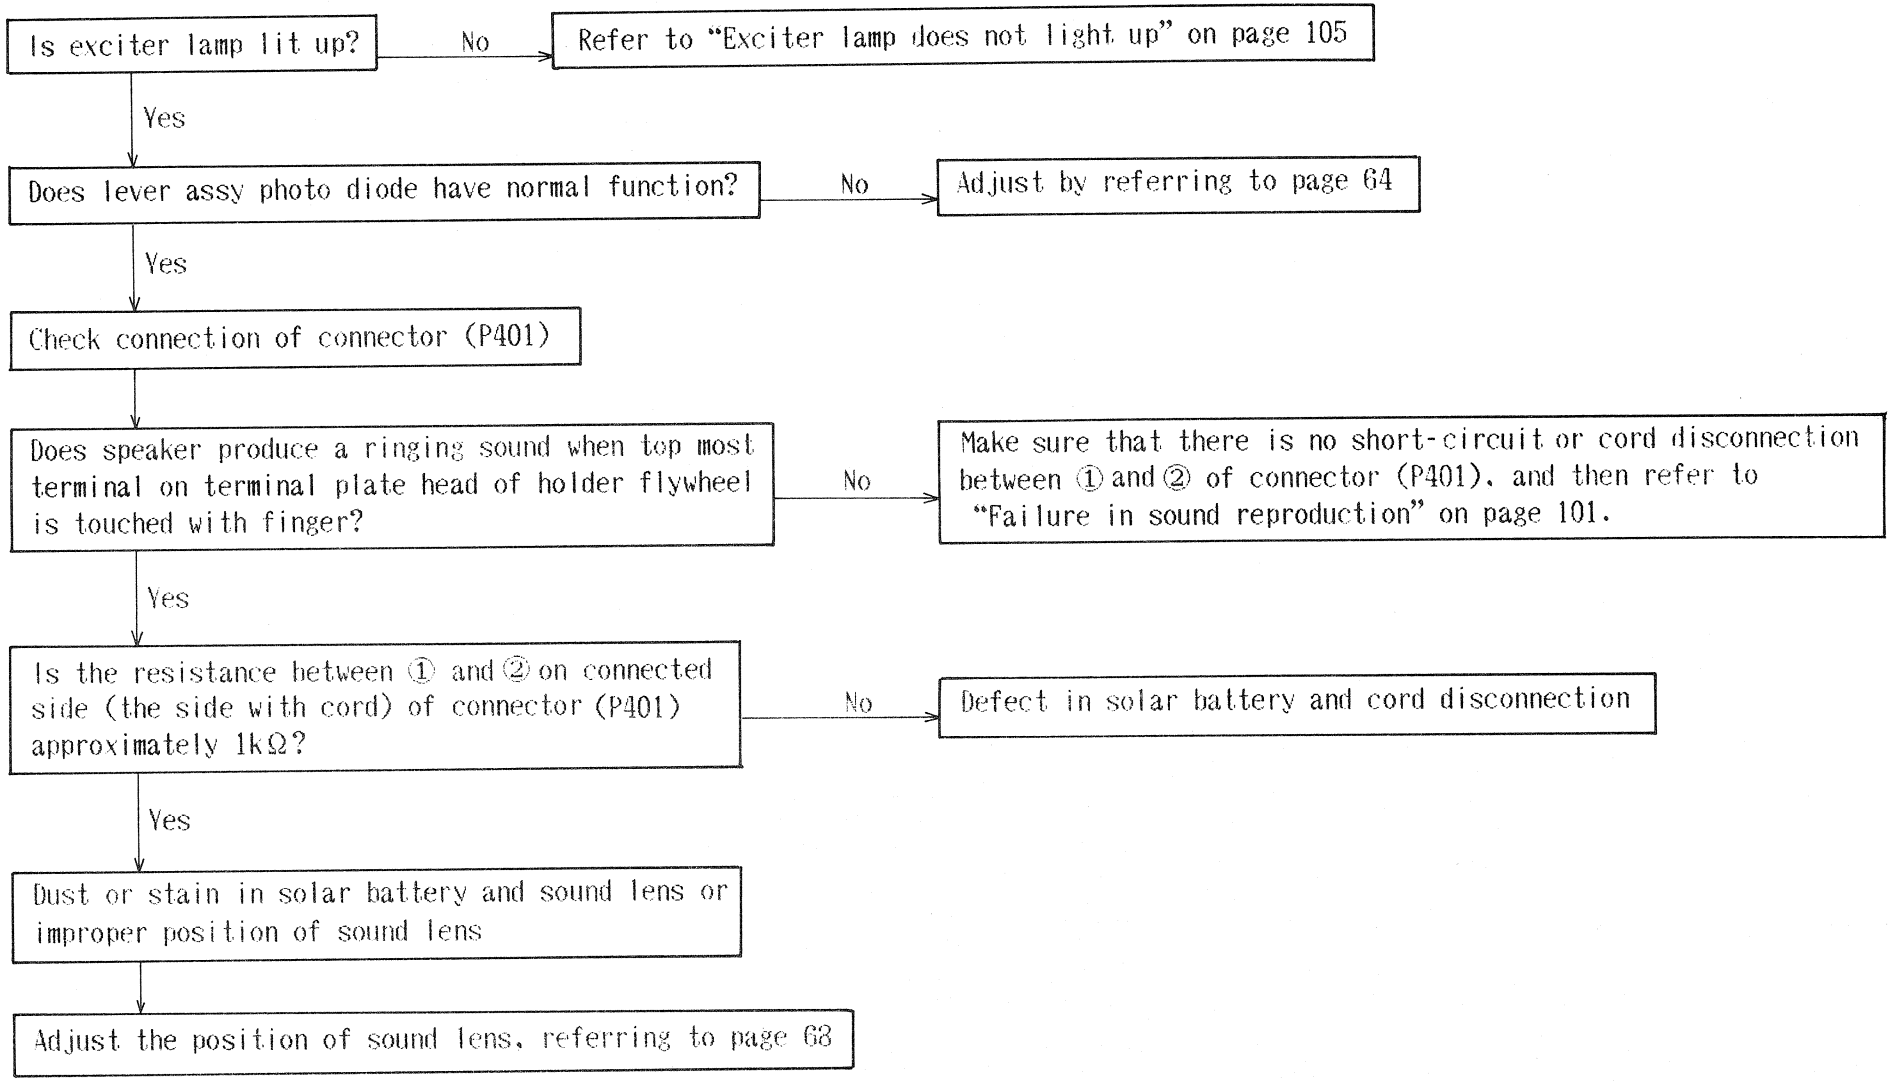
Check to see that connector (P404) is properly connected

↓

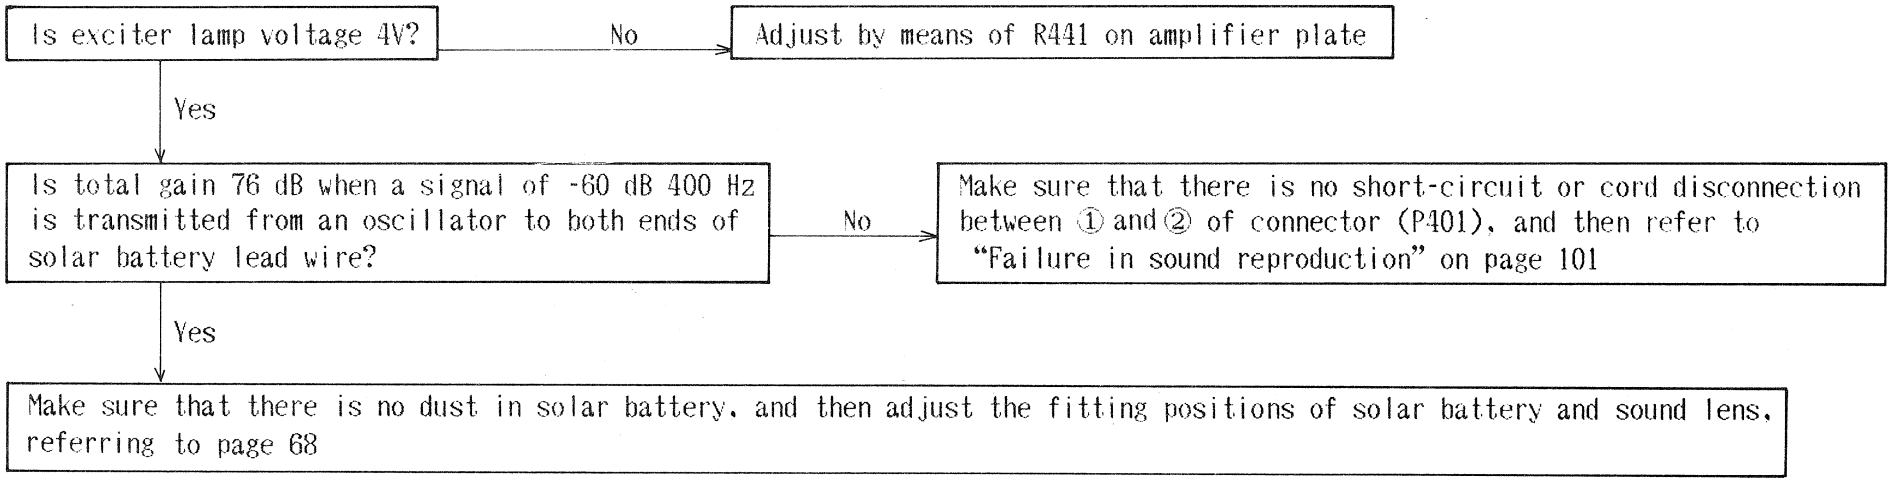
Check to see that switch circuit of external speaker jack (P407) has proper contact

Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

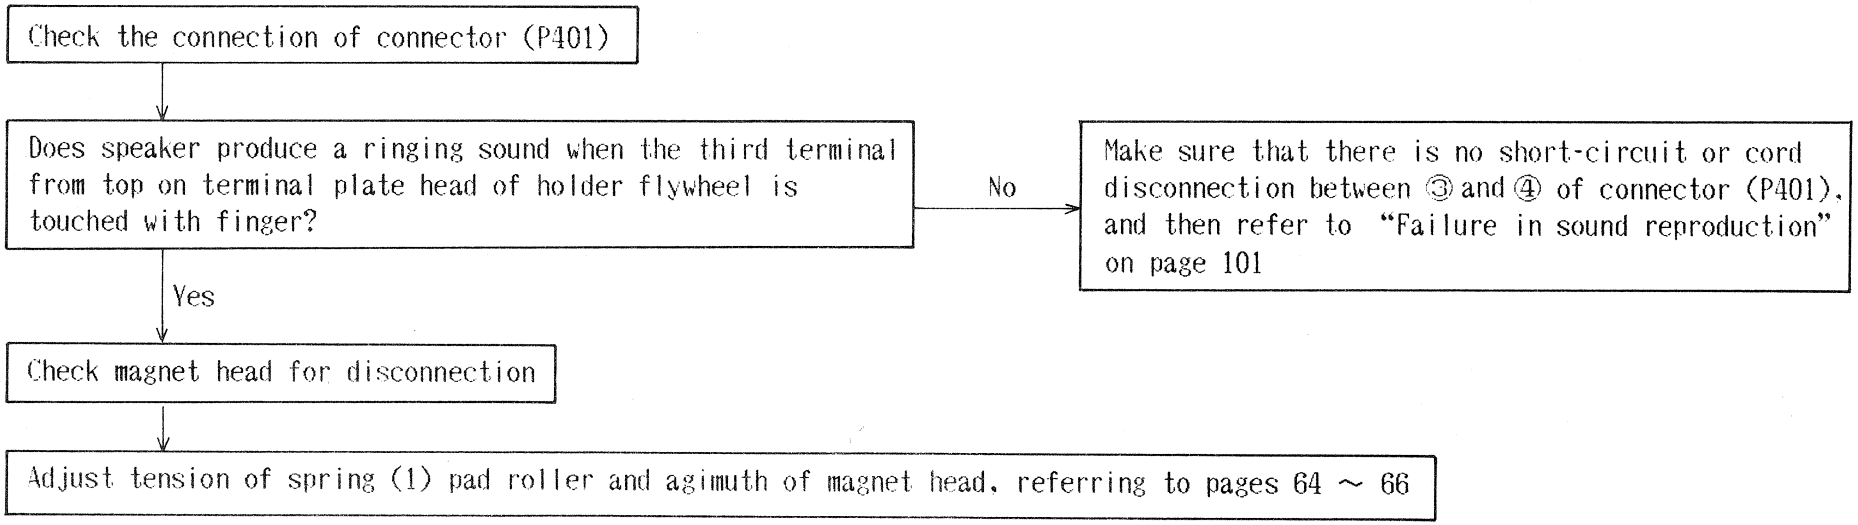
• Failure in optical reproduction (with normal magnetic and microphone sound reproduction)



• Optical reproduction sound is small (with normal magnetic and microphone reproduction sound).

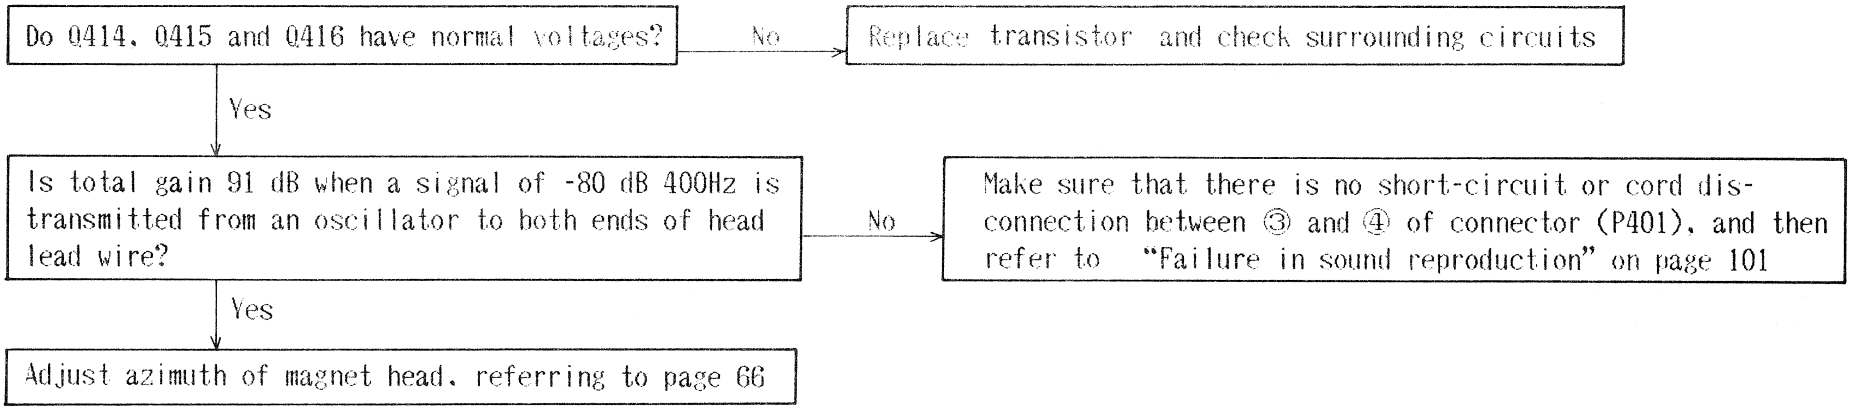


• Failure in magnetic reproduction (of sound)

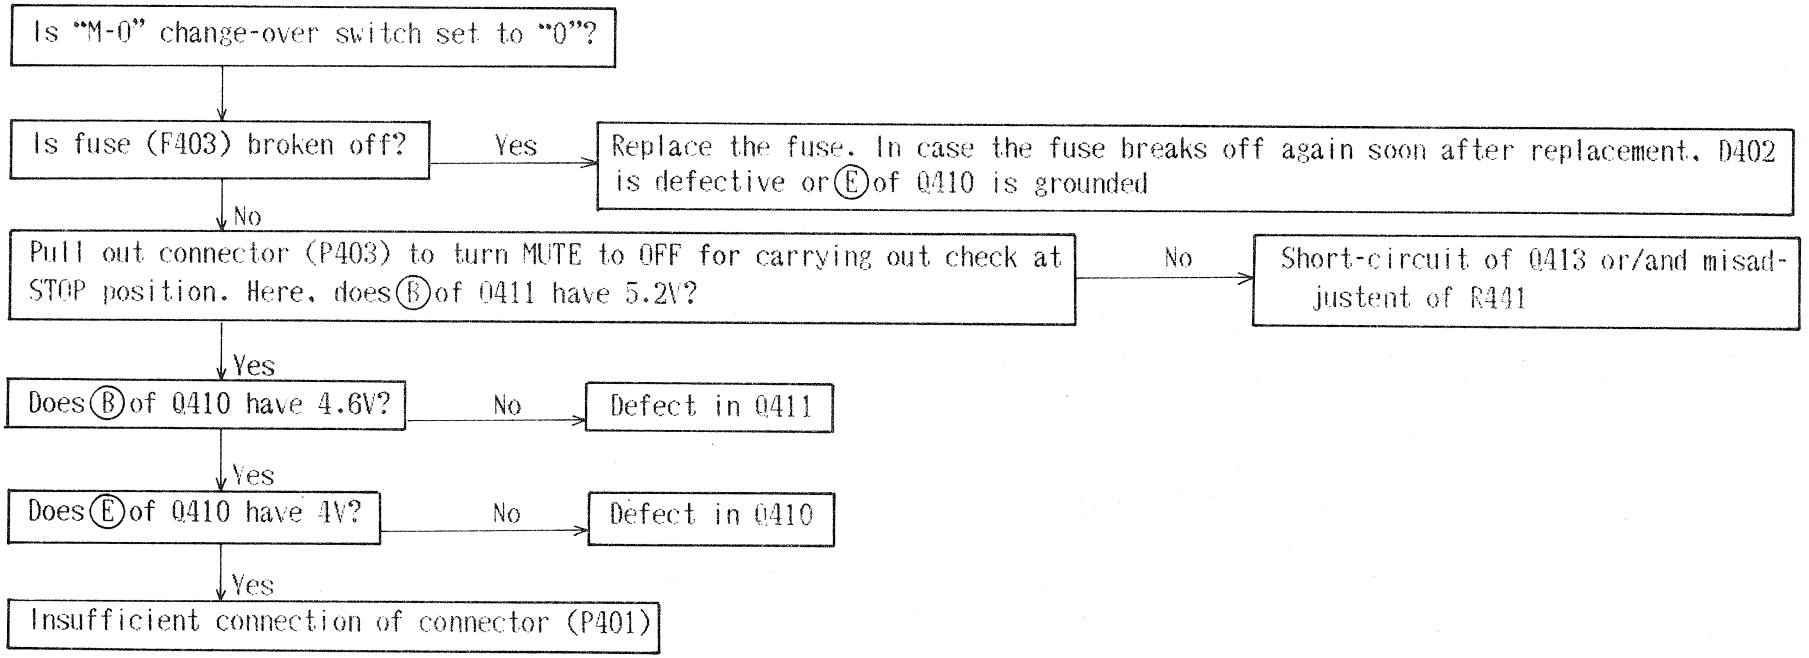


Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

• Magnetic reproduction sound is small (low).



• Exciter lamp does not light up. (Exciter lamp does not light at mode(s) other than FWD because of muting function).

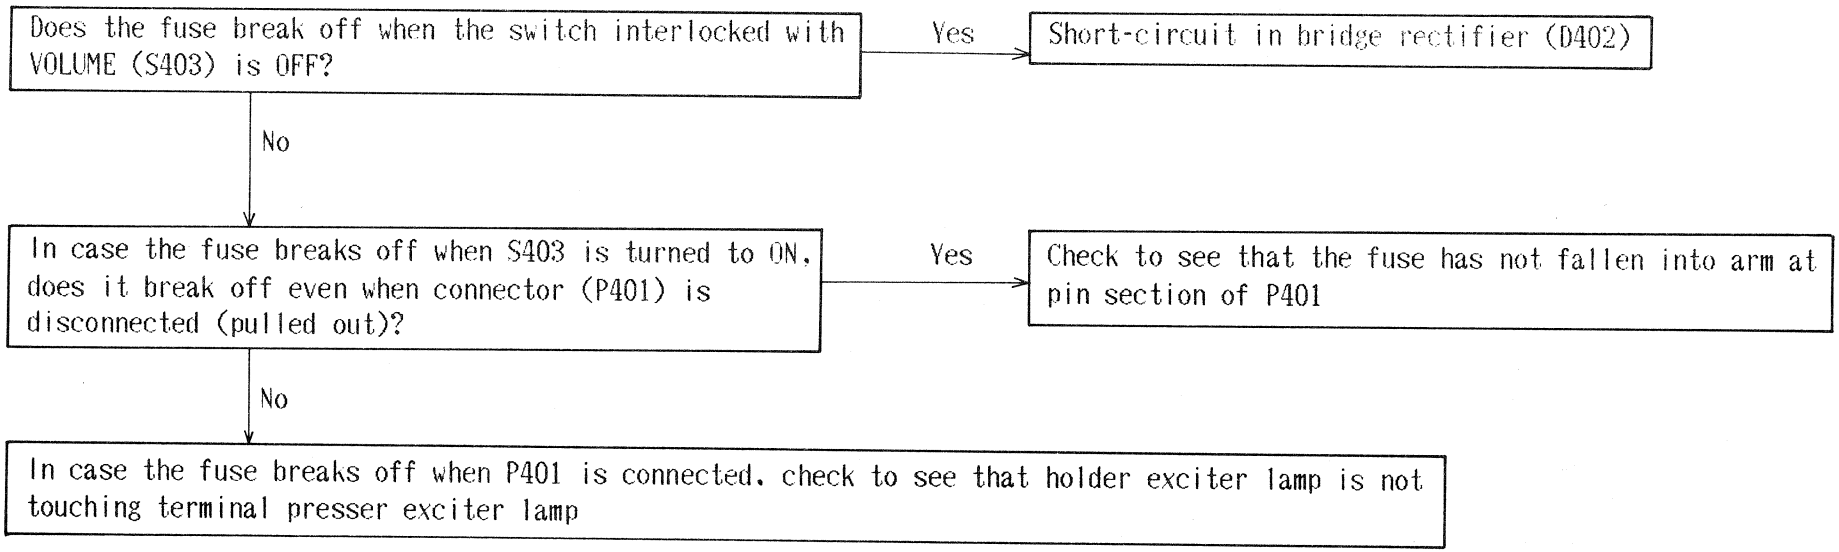


Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

- Amplifier fuses (F401 and F402) break off.

Short-circuit in bridge rectifier (D401)
↓
Short-circuit inside the power IC (Q402)

- Exciter fuse (F403) breaks off.



- Sound does not come out when microphone is used (with opeical and magnetic reproduction being normal).

Defect in microphone itself or in microphone jack (P405), S402-1 and S402-2

Ⅲ－4 Electrical Circuit Trouble-Shooting Hints

- Noise at optical reproduction

Check to see that the earth (black cord) of solar battery is not excessively slackened

↓

Check to see that the shielding wire of connector (P401) on the shielding side is not excessively slackened

↓

Check to see that the shielding wire of terminal plate head on the shielding side is not touching the holder flywheel (i.e. the shielding wire is not grounded at two points)

↓

Check to see that the fitting screws of printing board amplifier and chassis are not slackened.

↓

Check Q410 and Q411 if exciter power source has excessive ripples

- Noise at magnetic reproduction

Check to see that the cancel coil fitting position is proper → Refer to page 64 to adjust the fitting position

↓

Check to see that the shielding wire of connector (P401) on the shielding side is not excessively slackened

↓

Check to see that the shielding wire of terminal plate head on the shielding side is not touching the holder flywheel (i.e. the shielding wire is not grounded at two points)

↓

Check to see that the fitting screws of printing board amplifier and chassis are not slackened

Ⅳ TABLE FOR TROUBLES

	Trouble	Page
Intermittent film feeding section	Screen turbulence (bouncing)	44,46,48
	Screen turbulence (back feed)	44,46,48
	Screen running (tailing of image)	44,46
	Film shifting	44,46
	Auto loop setter fails to fuction	38,62
	Loop restorer continues functioning	62
	Screen gets chipped	48
	Exposure	48
	Masking adjustment can not be made	48
	Still-run change-over can not be made	44
	Still-run change-over is not smooth	44
	Film gets burned at still projection	44
	Excessively large noise at film feeding	44
	Scratch (flaw) of film	32,38,48,56,58
	Auto stop does not activate at self-loading	32,97
Film thread slot section	Self-loading mechanism fails to function (motor does not rotate)	32
	Does not set to loading position even when loop former is depressed	96
	Self-loading mechanism continues operating	32
	Auto stop does not activate at self-loading	32
	Film gets caught during self-loading	48,97
	Failure in upkeeping of self-loading	32,58
Film take-up and rewinding section	Failure in take-up	40
	Take-up arm can not be fixed	40
	Failure in rewinding	36
	Rewind arm can not be fixed	36
	Failure in high speed rewinding	34,38,92,94
	Film droops at forward projection	36

	Trouble	Page
Sound section	Failure in sound reproduction	101
	Opticcal reproduction sound does not come out	64,66,103
	Defective optical reproducing sound	64,66
	Optical reproduction sound is small	64,104
	Magenetic reproducing sound does not come out	64,66,104
	Defective magentic reproducing sound	64,66
	Magentic reproduction sound is small	64,66,105
	Internal sperker fails to reproduce sound	102
	Amplifier fuses break off	105
	Exciter fuse breaks off	106
	Exciter lamp does not light up	66,105
	Noise at optical reproduction	107
	Noise at magnetic reproduction	107
	Improper S/N ration	64
	Sound does not come out when microphone is used	106
	Excessively large wow flutter	38,40,42,56,58
Motor, lamp and control circuit section	Motor fails to operate	34,52,54,58,91
	Motor fails to stop	100
	Motor does not change over from normal to reverse operation or vice versa	54,99
	Unstable projection speed	42,44,52
	Lamp does not light up	34,54,92
	Failure in change-over of lamp L-H	54
	Control circit fails to function	54,91-100
	Failure in reverse projection	34,58
	Mechanism unit does not set to projection	34
	Cam motor fails to operate	34
	Operation cam continues rotating	95
	Link does not lock	95
	Failure in pause mechanism	34,93

V TOLERANCE

Item		Tolerance	Remarks
Pressure of side presser spring		45 - 55g	Refer to page 50.
Protrudent lengh of claw tip		0.9 - 1.1mm	Refer to page 44.
Framing adjustable amount		3 : 7	Refer to page 50.
Unsteady picture in forwarding	upward/downward	less than 3mm	Project a registration film (P086) at 24 fps. The picture size is 1 meter width.

PARTS LIST

16-AL　16-AL OPTICAL

No 256

April, 1988

Introduction

1. This parts list shows all of the spare parts for Elmo 16-AL and 16-AL Optical projectors.
2. Both the Double-encircled and the Single-encircled illustration numbers marked with # are the exclusive spare parts for 16-AL Optical projector.
3. On page 1, you can find the assembly parts with its parts number and the page to be referred to.
4. The spare parts marked with Double-encircled illustration number can be supplied as the assembly shape.
5. The parts number for conventional parts such as screws, nuts and E-rings is shown direct near its illustration.
6. The spare parts number encircled with a circlet in the column "Illustration No." is for Japanese market use.
   Please refer to page 12 and 13 for your market use.
7. Schematic diagram and its details are shown on page 15, 16 and 17.
8. The spare parts number index is on page 14.
9. The model name marked with # in the column "Common Use Model" indicates an improved model.
10. The figure in the brackets next to the illustration of a connector is the spare parts number for its connector-pin.
11. In some countries, the speaker cover assy. Parts No.4K01657 is offered as an optional item.

はじめに

1. このパーツリストには、16-AL及び16-ALOPTICAL の補修用部品が記載してあります。
2. 図中の＃印は、その部品のOPTICAL 専用部品です。
3. １ページにユニット別の分解図があり、各々の記載ページが表示してあります。索引としてご利用下さい。
4. イラスト番号が二重丸で表示してある部品は、組立品として供給できます。
5. ネジ・ナット・Ｅリング等基本部品の部品番号は、図中に直接表示してあります。
6. イラスト番号欄に○印が付記されている部品は、国内用とは異る国外部品があり12ページに、また国外のみ使用する部品は、13ページに表示してあります。
7. 結線図は、そこに使用されている部品の明細と共に、15、16、17ページにあります。
8. 部品番号索引は、14ページにあります。
9. 共用機種欄の※印は、その機種の改訂機との共用を表しています。
10. コネクタ横、カッコ内の数字は、そこに使用されているコネクタピンの部品番号です。

PARTS NUMBER INDEX

Parts No	Parts Name		Page and Illustration No.
4M42749	ホルダ 制御基板	Holder control plate	11−27
4M42750	レバー(1) M-O切換	Lever(1) M-O switch	6−32
4M42751	軸 フォーカシングツマミ	Shaft focusing knob	10−30
4M42752	フォーカシング座 映写レンズ	Focusing mount	10−25
4M42754	組立ループフォーマ	Loop former assy	4−34
4M42755	ホルダ(3) モータ	Holder(3) motor	10−15
4M42756	軸 レバー第2プロケット押工	Shaft 2nd sprocket press.	5−13
4M42757	保持板 プランジャフィルムガイド	Holder solenoid film guide	3−14
4M42758	戻シバネ ループフォーマ	Spring loop former	4−31
4M42759	ホルダSW. 挿入口	Holder slot sw.	4−30
4M43003	押工板 アンプコネクタ	Clasp amp. connector	11−32
4M43061	取付板 スピーカコネクタ	Holder speaker connector	2−10
4M43062	取付金具 スピーカカバー	Holder speaker cover	3−33
4M43063	ネット スピーカカバー	Net speaker cover	2−16
4M43064	プロテクタ スピーカカバー	Protector speaker cover	2−15
4M43066	ストッパ レバーフォトダイオード	Stopper lever photo diode	6−10
4M43067	バネ掛ケ間座 リンク(2)	Spring fixing screw	5−22
4M43068	間座 エルスコホルダ	Washer scope lens mount	5−35
4M43116	プーリ シャッタ 50Hz 18/24コマ	Pulley Shutter 50Hz 18·24	12−50
4M43117	プーリ(3) クラッチ	Pulley(3) Clutch	12−51
4M43128	遮熱板 ランプソケット	Heat shield lamp socket	10−18
4M43219	軸 ローラ	Shaft roller	4−38
4M43243	板バネ ホルダ(1)プレッシャプレート	Spring holder(1) P.P	7−2
4M43244	補強板 ホルダ操作カム	Support holder cam	5−46
4M43245	組立補強板 挿入口	Support assy slot	4−47
4M43247	中間遮熱板	Heat shielding plate	7−15
4M43250	組立プーリ(2) 巻取	Pulley(2) assy take-up	9−13
4M43252	軸 中間ギヤ巻返	Shaft middle gear rewind	8−20
4M43253	プロテクタ	Protector	3−30
4M43254	組立取付板 ベルト案内ローラ	Holder belt guide roller	9−19

Parts No	Parts Name		Page and Illustration No.
4M43255	組立プリント基板 電源トランス	Circuit board assy trans	11−4
4M43256	ローラ(2) 第2スプロケット押工	Roller(2) second sprocket	5−10
4M43260	歯 第1スプロケット	Cog first sprocket	8−49
4M43331	組立レバー(1) 停止映写	Lever(1) assy still proj.	9−42
4M43343	コードブッシュ リモコン	Bush remote	2−19
4M43366	止メ板 ホルダフィルムガイド	Stopper holder film guide	3−10
4M43388	組立レバー アーム巻取	Lever arm take-up assy	9−28
4M43468	前カバー	Front cover assy	12−20
4M43502	パッド スピーカ	Pad speaker	2−13
4M43504	ボタン アーム巻返	Button arm rewind	8−16
4M43505	補強板 アーム巻取側	Support take-up Arm	9−26
4M43506	補強板 アーム巻返側	Support rewind arm	8−44
4M43602	プーリ(2) 上巻取	Pulley(2) upper take-up	9−30
4M43645	摩擦車(2) ループセッタ	Friction wheel 2	5−48
4M50093	調節ネジ ホルダ映写レンズ	Screw holder proj. lens	10−32
4M50223	バネ プーリ(2) クラッチ	Spring pulley(2) clutch	7−72
4M50226	摩擦板	Friction plate	8−55
4M50229	バネ 逆転スリップ	Spring reverse tension	8−52
4M50231	取付ネジ ロック板	Screw lock plate	4−19 5−42 9−47
4M50232	戻シバネ ロック板	Spring lock plate	4−48
4M50234	バネ 取付板シュー(1)	Spring holder shoe 1	4−41
4M50235	取付ネジ ループフォーマ	Screw loop former	4−33
4M50238	ローラ リンクロック	Roller link lock	5−55
4M50239	取付ネジ ローラリンクロック	Screw link lock	5−54
4M50241	取付ネジ 取付板リンク(1)	Screw holder link 1	5−26
4M50242	バネ ループセッタ	Spring loop setter	5−52
4M50244	ベルト 案内ローラ	Belt guide roller	9−22
4M50247	間座 レバークラッチ寄セ	Washer clutch mover	9−45
4M50250	バネ ロック板レバーガイドローラ(3)	Spring lock plate guide 3	5−44
4M50251	バネ ソレノイド	Spring solenoid	5−19
